LoRaWAN® Backend Interfaces Technical Specification (TS002-1.1.0)

Authored by the LoRa Alliance Technical Committee

Technical Committee Chair and Vice-Chair:

A.YEGIN (Actility), O.SELLER (Semtech)

Editor:

A.YEGIN (Actility)

Contributors:

B.AMPEAU (AFNIC), S.BALAKRICHENAN (AFNIC), A.BETOLAUD (Gemalto), E.BRUINZEEL (KPN), J.CATALANO (Kerlink), P.CHRISTIN (Orange), P.COLA (Bouygues Telecom), P.DUFFY (Cisco), F.DYDUCH (Bouygues Telecom), J.ERNST (Swisscom), E.FORMET (Orange), O.HERSENT (Actility), D.KJENDAL (Senet), M.KUYPER (TrackNet), M.LEGOURRIEREC (Sagemcom), C.LEVASSEUR (Bouygues Telecom), M.PAULIAC (Gemalto), N.SORNIN (Semtech), P.K.THOMSEN (Orbiwise), A.YEGIN (Actility)

Version: 1.1.0

Date: Oct 19, 2020

Status: Final

186 1 Introduction

187

188 This document describes the standard interfaces and message flow between

- 189 1. A Network Server and a Join Server
- 190 2. A Join Server and an Application Server
- 191 3. Two Network servers in the case of roaming traffic routing

192

193 The Network Server to Application Server interface is outside the scope of this document.

194

195 The primary focus of this document is to describe the message flow between the various entities
196 of the network during the Over-the-Air Activation and Roaming Procedures of an End-Device.

197

198

199 2 Conventions

200

201 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD",
202 "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be
203 interpreted as described in RFC 2119.

204

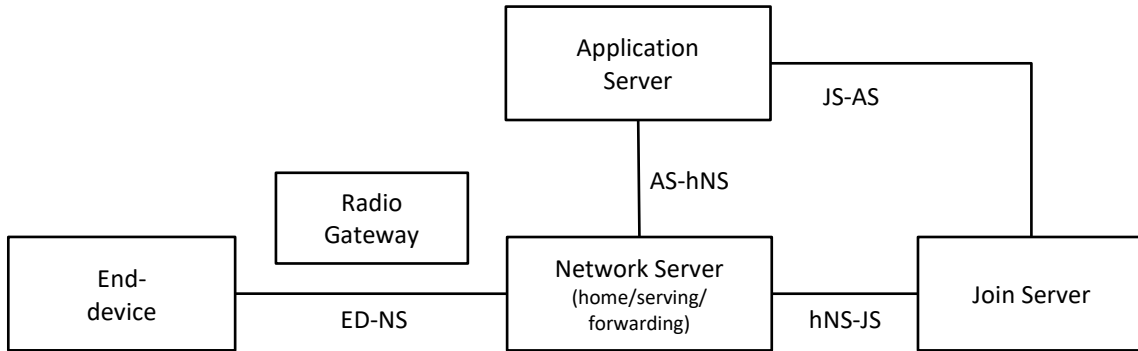

205 The tables in this document are normative. The figures in this document are informative.

206

207

208 **3 Network Reference Model**

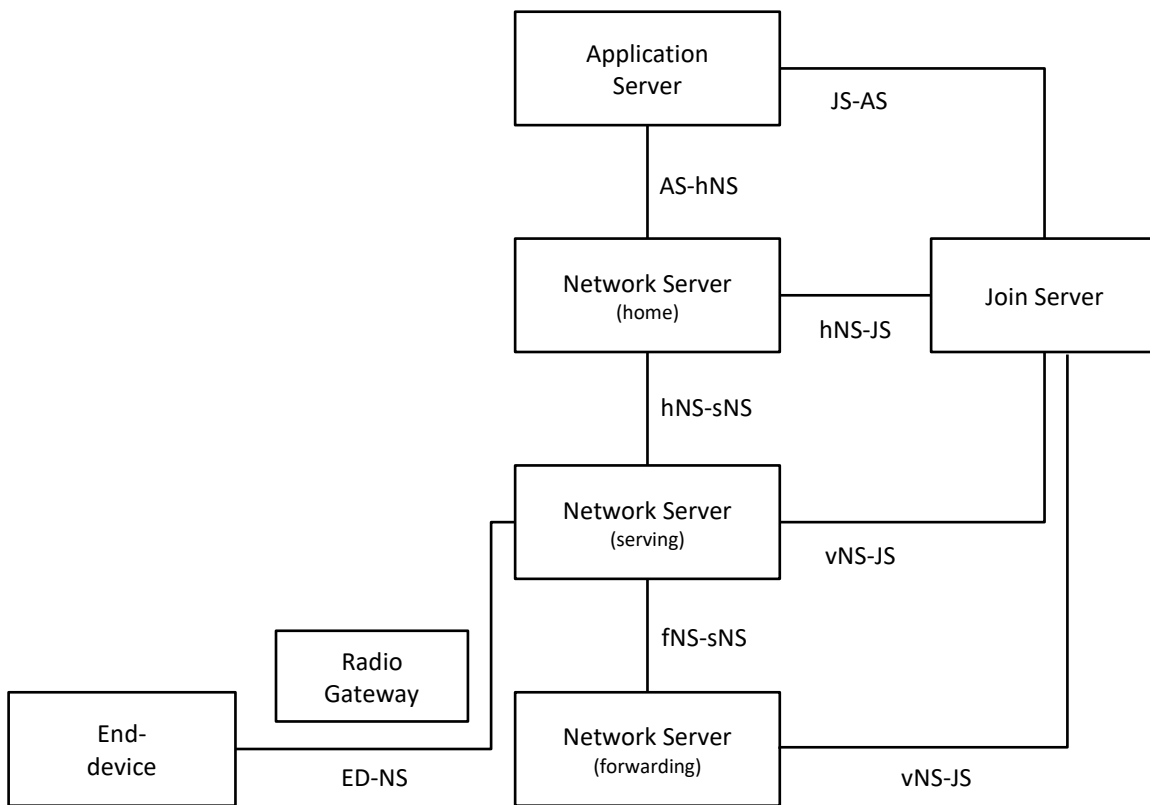

209 Figure 1 and Figure 2 show the Network Reference Model (NRM) for the LoRaWAN architecture.
 210
 211

212 **Figure 1 LoRaWAN Network Reference Model (NRM), End-Device at home**

213

214

215 **Figure 2 LoRaWAN Network Reference Model (NRM), roaming End-Device**

216

217 End-Device:

218 The End-Device is a sensor or an actuator. The End-Device is wirelessly connected to a
 219 LoRaWAN network through Radio Gateways. The application layer of the End-Device is
 220 connected to a specific Application Server in the cloud. All application layer payloads of this End-
 221 Device are routed to its corresponding Application Server.
 222
 223

224
225
226 Radio Gateway:
227
228 The Radio Gateway forwards all received LoRaWAN radio packets to the Network Server that is
229 connected through an IP back-bone. The Radio Gateway operates entirely at the physical layer.
230 Its role is simply to decode uplink radio packets from the air and forward them unprocessed to
231 the Network Server. Conversely, for downlinks, the Radio Gateway simply executes transmission
232 requests coming from the Network Server without any interpretation of the payload.
233
234
235 Network Server:
236
237 The Network Server (NS) terminates the LoRaWAN MAC layer for the End-Devices connected to
238 the network. It is the center of the star topology. Each NS is identified by a unique NSID (an
239 IEEE EUI64 identifier), and can be configured with one or more NetIDs.
240
241 Generic features of NS are:

- 242 • End-Device address check,
- 243 • Frame authentication and frame counter checks,
- 244 • Acknowledgements,
- 245 • Data rate adaptation,
- 246 • Responding to all MAC layer requests coming from the End-Device,
- 247 • Forwarding uplink application payloads to the appropriate Application Servers,
- 248 • Queuing of downlink payloads coming from any Application Server to any End-Device
249 connected to the network,
- 250 • Forwarding Join-request and Join-accept messages between the End-Devices and the
251 Join Servers.

252
253 In a roaming architecture, an NS may play three different roles depending on whether the End-
254 Device is in roaming situation or not, and the type of roaming that is involved.
255
256 Serving NS (sNS) controls the MAC layer of the End-Device.
257
258 Home NS (hNS) is where Device Profile, Service Profile, Routing Profile and DevEUI of the End-
259 Device are stored. hNS has a direct relation with the Join Server that will be used for the Join
260 Procedure. It is connected to the Application Server (AS). When hNS and sNS are separated,
261 they are in a roaming agreement. Uplink and downlink packets are forwarded between the sNS
262 and the hNS.
263
264 Forwarding NS (fNS) is the NS managing the Radio Gateways. When sNS and fNS are
265 separated, they are in a roaming agreement. There may be one or more fNS serving the End-
266 Device. Uplink and downlink packets are forwarded between the fNS and the sNS.
267
268
269 Join Server:
270
271 The Join Server (JS) manages the Over-the-Air (OTA) End-Device activation process. There
272 may be several JSs connected to a NS, and a JS may connect to several NSs.
273
274 The End-Device signals which JS should be interrogated through the JoinEUI field of the Join-
275 request message. Each JS is identified by a unique JoinEUI value. Note that AppEUI field of the

276 Join-request in LoRaWAN 1.0/1.0.2 [LW10, LW102] is renamed to JoinEUI field in LoRaWAN 1.1
277 [LW11]. The term JoinEUI is used to refer to the AppEUI in the context of LoRaWAN 1.0/1.0.2
278 End-Devices in this specification.

279
280 The JS knows the End-Device's Home Network Server identifier and provides that information to
281 the other Network Servers when required by the roaming procedures.

282
283 The JS contains the required information to process uplink Join-request frames and generate the
284 downlink Join-accept frames. It also performs the network and application session key
285 derivations. It communicates the Network Session Key of the End-Device to the NS, and the
286 Application Session Key to the corresponding Application Server.

287
288 For that purpose the JS SHALL contain the following information for each End-Device under its
289 control :

- 290 • DevEUI
- 291 • AppKey
- 292 • NwkKey (only applicable to LoRaWAN 1.1 End-Device)
- 293 • Home Network Server identifier
- 294 • Application Server identifier
- 295 • A way to select the preferred network in case several networks can serve the End-Device
- 296 • LoRaWAN version of the End-device (LoRaWAN 1.0, 1.0.2, or 1.1)

297
298 The root keys NwkKey and AppKey are only available in the JS and the End-Device, and they
299 are never sent to the NS nor the AS.

300
301 Secure provisioning, storage, and usage of root keys NwkKey and AppKey on the End-Device
302 and the backend are intrinsic to the overall security of the solution. These are left to
303 implementation and out of scope of this document. However, elements of this solution may
304 include SE (Secure Elements) and HSM (Hardware Security Modules).

305
306 The way those information are actually programmed into the JS is outside the scope of this
307 document and may vary from one JS to another. This may be through a web portal for example
308 or via a set of APIs.

309
310 The JS and the NS SHALL be able to establish secure communication which provides end-point
311 authentication, integrity and replay protection, and confidentiality. The JS SHALL also be able to
312 securely deliver Application Session Key to the Application Server.

313
314 The JS may be connected to several Application Servers (AS), and an AS maybe connected to
315 several JSs.

316
317 The JS and the AS SHALL be able to establish secure communication which provides end-point
318 authentication, integrity, replay protection, and confidentiality.

319
320

321 Application Server:

322

323 The Application Server (AS) handles all the application layer payloads of the associated End-
324 Devices and provides the application-level service to the end-user. It also generates all the
325 application layer downlink payloads towards the connected End-Devices.

326

327 There may be multiple ASs connected to a NS, and an AS may be connected to several NSs
328 (operating End-Devices through several networks, for example). An AS may also be connected
329 to multiple JSs.

330

331 The Home NS routes the uplinks toward the appropriate AS based on the DevEUI.

332

333 In addition to the aforementioned network elements, LoRaWAN architecture defines the following
334 network interfaces among these entities:

335

336 hNS-JS: This interface is used for supporting the Join (Activation) Procedure between the JS and
337 the NS.

338

339 vNS-JS: This interface is used for Roaming Activation Procedure. It is used to retrieve the NSID
340 and NetID of the hNS associated with the End-Device.

341

342 ED-NS: This interface is used for supporting LoRaWAN MAC-layer signaling and payload
343 delivery between the End-Device and the NS.

344

345 AS-hNS: This interface is used for supporting delivery of application payload and also the
346 associated meta-data between the AS and the NS.

347

348 hNS-sNS: This interface is used for supporting roaming signaling and payload delivery between
349 the hNS and the sNS.

350

351 sNS-fNS: This interface is used for supporting roaming signaling and payload delivery between
352 the sNS and the fNS.

353

354 AS-JS: This interface is used for delivering Application Session Key from the JS to the AS.

4 End-Device Types and States

There are two types of LoRaWAN End-Devices: Activation-by-Personalization (ABP) activated End-Devices, and Over-the-Air (OTA) activated End-Devices. ABP End-Devices are directly tied to a specific network by skipping the Join Procedure. OTA End-Devices perform Join Procedure to get activated on a selected network.

Figure 3 shows the two types of End-Devices and various End-Device states associated with the OTA End-Devices.

Figure 3 End-Device types and states

An ABP End-Device SHALL have the following information either when it leaves the manufacturer or upon configuration thereafter: DevAddr, AppSKey, network session keys. Network session keys are SNwkSIntKey, FNwkSIntKey, and NwkSEncKey in case of a R1.1, and NwkSKey in case of a R1.0/1.0.2 End-Device. For that End-Device to readily use the network, its Home NS SHALL have the DevAddr, network session keys, AS info of the End-Device; and the AS SHALL have the DevAddr, AppSKey of the End-Device.

An OTA End-Device SHALL have the following information either when it leaves the manufacturer or upon configuration thereafter: DevEUI, NwkKey (R1.1-only), AppKey, JoinEUI. At this point it is called a Generic End-Device. The associated JS SHALL have DevEUI, AppKey, NwkKey (R1.1-only) of the End-Device. No NS or AS may have any information about the Generic End-Device until it is commissioned.

382 Reconfiguration of an End-Device may be possible during its lifecycle. Configuration and
383 reconfiguration procedure details are outside the scope of this specification.
384

385 Commissioning procedure associates the End-Device with its Home NS and a specific AS. The
386 JS of a commissioned OTA End-Device SHALL have the Home NS info for the End-Device. The
387 AS associated with the End-Device SHALL have the DevEUI of the End-Device. The Home NS
388 SHALL have various profile information related to the End-Device and its service subscription.
389 Mechanisms used for provisioning the AS, JS, and NS with the required information is outside
390 the scope of this specification.
391

392 When a commissioned OTA End-Device performs successful Join (Activation) Procedure, it
393 knows DevAddr, network session keys, and AppSKey. The JS knows the DevEUI, DevAddr,
394 network session keys, AppSKey, and DevNonce. The JS delivers the DevEUI and AppSKey to
395 the AS. The JS delivers the network session keys, and optionally the encrypted AppSKey to the
396 NS.

397 5 Commissioning Procedure

398
399 Commissioning Procedure is executed by the AS, JS (only applicable to OTA), and NS for a
400 given End-Device. It involves the JS associating the End-Device with a Home NS (only
401 applicable to OTA), the Home NS and the AS receiving the profile information related to the End-
402 Device and its service subscription. The mechanisms used for provisioning the required
403 information on the aforementioned network elements is outside the scope of this specification.
404

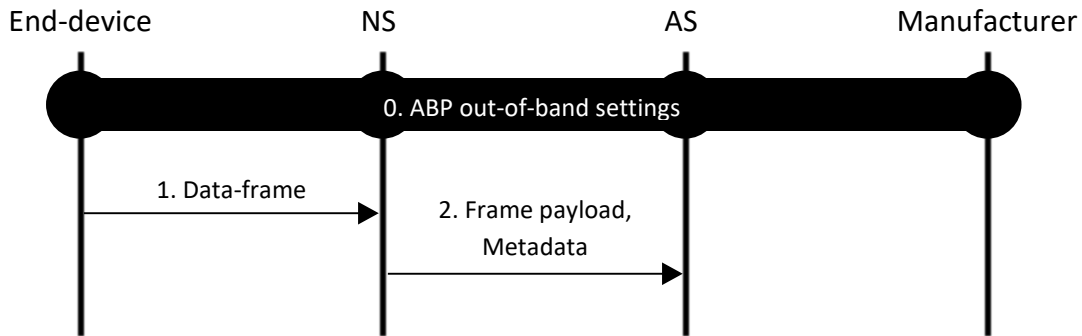

405 Decommissioning Procedure breaks the association between the End-Device and the Home NS
406 and the AS. This procedure involves resetting the state created on the AS and NS at the time of
407 commissioning, unbinding the End-Device and Home NS on the JS (only applicable to OTA).
408

409 Details of the Commissioning and Decommissioning Procedures are outside the scope of this
410 specification.
411

412 **6 Activation of ABP End-Devices**

413

414 Figure 4 shows activation of an ABP End-Device with an NS. This procedure applies to both
 415 R1.0 [LW10, LW102] and R1.1 [LW11] End-Devices and networks.
 416

417
 418

Figure 4 Activation of ABP End-Device

419

420 Step 0:

421

422 The End-Device, NS, and AS are configured with the required information, so that the End-
 423 Device can send packets as soon as it is powered on.

424

425 Step 1:

426

427 When the End-Device has application payload to send, it can do so without performing any setup
 428 signaling with the network. The packet includes application payload that is encrypted using the
 429 AppSKey, and the MIC that is generated using the network session integrity keys (SNwkSIntKey
 430 and FNwkSIntKey in case of a R1.1 End-Device, and NwkSKey otherwise).

431

432 When the NS receives the packet, it SHALL perform network session integrity key lookup based
 433 on the DevAddr of the received packet. The NS SHALL verify the MIC using the retrieved keys. If
 434 the keys are not found, or if the MIC verification fails, the NS SHALL drop the packet.

435

436 Step 2:

437

438 The NS SHALL send the encrypted payload of the accepted packet to the AS associated with the
 439 End-Device. The application payload may be accompanied with the metadata, such as DevAddr,
 440 FPort, timestamp, etc. The NS SHALL consider receipt of the very first packet from the End-
 441 Device as the activation of a LoRa session for the End-Device.

442

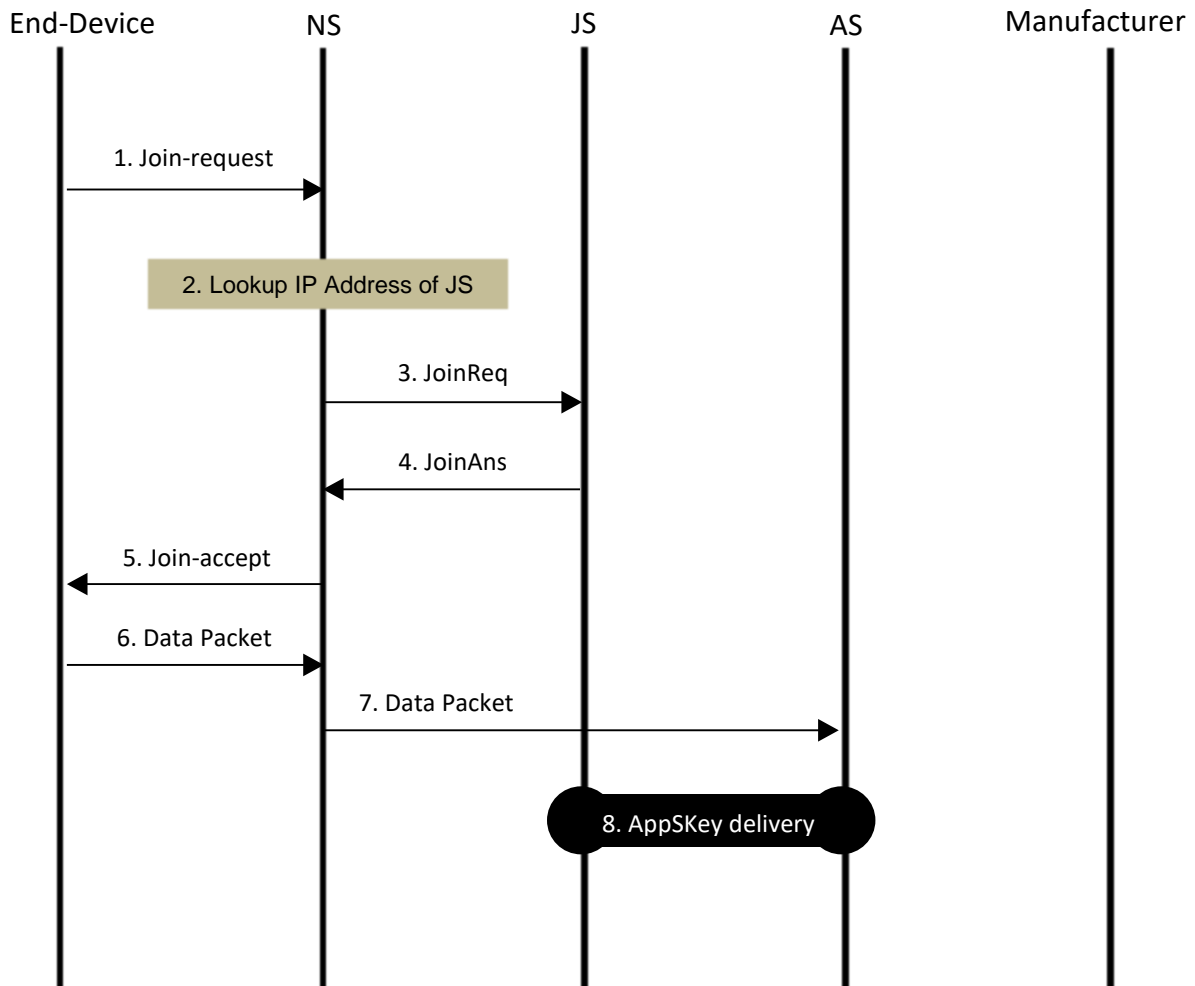

443 7 Activation of OTA End-Devices

444
445 OTA Activation Procedure is used by the End-Device in order to mutually authenticate with the
446 network and get authorized to send uplink and receive downlink packets.
447
448 NSs are categorized in two ways with respect to an End-Device. Home NS is the NS that holds
449 the End-Device, Service, and Routing Profiles of the End-Device, and interfaces with the AS and
450 the JS after any activation. The mechanism used for provisioning the Home NS with the required
451 profile information is outside the scope of this specification. On the other hand, Visited NS is any
452 other NS that has a business and technical agreement with the Home NS for being able to serve
453 the End-Device.
454
455 There are two variants of the Activation Procedure, namely Activation at Home, and Roaming
456 Activation.
457
458 Activation at Home: The End-Device performs the Activation Procedure within the radio coverage
459 of the Home NS. At the end of the procedure, the Home NS is the only NS serving the End-
460 Device for reaching out to the AS and the JS.
461
462 Roaming Activation: The End-Device performs the Activation Procedure outside the radio
463 coverage of its Home NS but within the coverage of a Visited NS. In this procedure, the Visited
464 NS learns the identity of the Home NS with the help of the JS and obtains the required End-
465 Device and Service Profiles from the Home NS. At the end of the procedure, the End-Device is
466 served by both the Visited NS and the Home NS for reaching out to the AS and the JS.
467
468 When the End-Device performs a successful Join or Rejoin Procedure, the End-Device is said to
469 have a LoRa session with the backend. Each LoRa session is associated with a set of context
470 parameters managed on the End-Device, and the NS, JS, and AS. (e.g., session keys, DevAddr,
471 ID of NS, etc.). The LoRa session terminates when the End-Device performs Deactivation (Exit)
472 Procedure or another successful Join/Rejoin Procedure.
473

474 **8 OTA Activation at Home Procedure**

475
476
477
478

Figure 5. illustrates the message flow for OTA Activation at Home Procedure. This procedure applies to both R1.0 [LW10, LW102] and R1.1 [LW11] End-Devices and networks.

490
491
492
493
494
495
496

Figure 5 Message flow for OTA Activation at Home Procedure.

Step 1:

The End-Device SHALL transmit a Join-request message.

Step 2:

When the NS receives the Join-request message, the NS SHALL determine whether it is the Home NS for the End-Device identified by DevEUI, or not. In this flow it is assumed that the NS is the Home NS of the End-Device. See Section 12 for the case where the NS is not the Home NS of the End-Device, but the NS is configured to use the JS for Roaming Activation Procedure. If the NS is neither the Home NS of the End-Device nor configured to use the JS, then the NS SHALL silently ignore the Join-request and the procedure terminates here.

497 The NS SHALL use DNS to lookup the IP address of the JS based on the Join-request message
 498 (see Section 20 for further details), if the NS is not already configured with the IP
 499 address/hostname of the JS by an out-of-band mechanism. If DNS lookup fails, then the NS
 500 SHALL terminate the procedure here.

501
 502 For R1.0 [LW10] End-Devices configured with an AppEUI not identifying a Join Server, the NS
 503 SHOULD be configured with the IP address/hostname of the JS by an out-of-band mechanism.
 504

505 Step 3:

506
 507 The NS sends a JoinReq message to the JS carrying the PHYPayload of the Join-request
 508 message, MACVersion, DevEUI, DevAddr, DLSettings, RxDelay, and optionally CFList. The NS
 509 SHALL set the value of the MACVersion to the highest common version between the End-Device
 510 and the NS.

511 Step 4:

512
 513 The JS SHALL process the Join-request message according to the MACVersion and send
 514 JoinAns to the NS carrying Result=Success, PHYPayload with Join-accept message, network
 515 session keys (SNwksIntKey, FNwksIntKey, and NwksEncKey in case of a R1.1, and NwksKey
 516 in case of a R1.0/1.0.2 End-Device), either the encrypted AppSKey or SessionKeyID or both,
 517 and Lifetime in case of success, and Result=UnknownDevEUI in case End-Device is not
 518 recognized by the JS, Result=MICFailed in case the MIC of the Join-request failed verification,
 519 Result=FrameReplayed in case the DevNonce was used before, Result=JoinReqFailed in any
 520 other error cases.
 521

522
 523 JS may create SessionKeyID which is associated with the generated session keys.
 524

525 SNwksIntKey, FNwksIntKey, NwksEncKey, and AppSKey are generated based on the
 526 LoRaWAN 1.1 specification [LW11] for R1.1 End-Devices. NwksKey is generated based on the
 527 LoRaWAN 1.0 specification [LW10] for R1.0/R1.0.2 End-Devices. AppSKey is encrypted using a
 528 key shared between the JS and the AS when it is delivered from the JS to the NS.
 529

530 For R1.0 [LW10] End-Devices, the JS SHALL process the Join-request message also when the
 531 AppEUI is not identifying the JS.
 532

533 Step 5:

534
 535 The NS SHALL forward the received PHYPayload with Join-accept message to the End-Device if
 536 the received JoinAns message indicates Success. The End-Device SHALL generate the
 537 network session keys, and AppSKey based on the LoRaWAN specification [LW10, LW102,
 538 LW11] upon receiving the Join-accept message.
 539

540 Step 6:

541
 542 When the NS receives an uplink packet from the End-Device, the NS SHALL send the DevEUI,
 543 and encrypted AppSKey or SessionKeyID or both along with the application payload to the AS.
 544

545 Step 7:

546
 547 When AS receives the encrypted AppSKey along with the application payload, then the AS
 548 SHALL decrypt the AppSKey using a secret key shared between the JS and the AS, and use the

549 AppSKey to decrypt the received payload. If the encrypted AppSKey is not made available by the
550 NS, then the AS SHALL proceed to the next step.

551

552 Step 8:

553

554 This step takes place in case the AS wants to receive the AppSKey directly from the JS.

555

556 The AS SHALL request the AppSKey identified by the DevEUI of the End-Device and the
557 SessionKeyID from the JS by sending an AppSKeyReq message. The AppSKey is encrypted using
558 a shared secret between the JS and the AS. The JS sends the encrypted AppSKey, DevEUI and
559 the SessionKeyID to the AS in an AppSKeyAns message. Then the AS SHALL decrypt the
560 encrypted AppSKey using a secret key shared between the JS and the AS. Then, the AS starts
561 using the AppSKey to encrypt and decrypt the application payload.

562

563 OTA activation of a commissioned End-Device can happen both when the NS and the JS belong
564 to the same administrative domain and when they belong to two separate administrative
565 domains.

566

567

568 **9 Deactivation (Exit) of OTA End-Devices**

569
570 LoRa session of an OTA-activated End-Device can also be terminated for various reasons, such
571 as user reaching end of contract, malicious End-Device behavior, etc. The procedure used for
572 deactivating the session is the Exit Procedure, which is the counter-part of the Join Procedure.
573

574 There is no explicit and dedicated LoRaWAN signaling for performing the Exit Procedure. It is
575 assumed that the End-Device and the backend rely on application-layer signaling to perform this
576 procedure. Triggers and the details of application-layer signaling are outside the scope of this
577 specification.
578

579 When the hNS is notified about the Exit Procedure by the AS and there is a separate sNS, then
580 the hNS SHALL perform Handover Roaming Stop Procedure to convey the termination of the
581 LoRaWAN session to the sNS.
582

583 The End-Device successfully performing a new Join/Rejoin Procedure also terminates the
584 current LoRaWAN session, and in a way, it can be considered as the Deactivation associated
585 with that session.
586
587

588 **10 Security Associations**

 589 Table 1 shows the security associations used by the LoRaWAN deployments. Some of the
 590 required security associations will be detailed in the LoRaWAN specification, and some are left to
 591 the deployments.
 592
 593

End-points	Type	In or out of scope for LoRa spec.	Used for	Created by (if dynamic)	Key names
ED-JS	Static	In-scope	Securing Join/Rejoin	-	AppKey, NwkKey
ED-NS	Dynamic	In-scope	Securing over-the-air frame delivery	Join Procedure	SNwkSIntKey, FNwkSIntKey, NwkSEncKey, NwkSKey
ED-AS	Dynamic	In scope	Securing end-to-end frame payload delivery	Join Procedure	AppSKey
JS-NS	Static	Out of scope	Securing Join/Rejoin and session key delivery	-	-
AS-JS	Static	In scope	Securing AppSKey delivery	-	ASJSKey
	Static	Out of scope	Commissioning/Decommissioning	-	ASJSKey
JS-Manufacturer	Static	Out of scope	Securing AppKey/NwkKey delivery	-	-
AS-NS	Static	Out of scope	Securing frame delivery	-	-
NS-NS	Static	Out of scope	Securing Join/Rejoin and inter-NS frame delivery	-	-

 594
 595 **Table 1 LoRaWAN security associations**

596

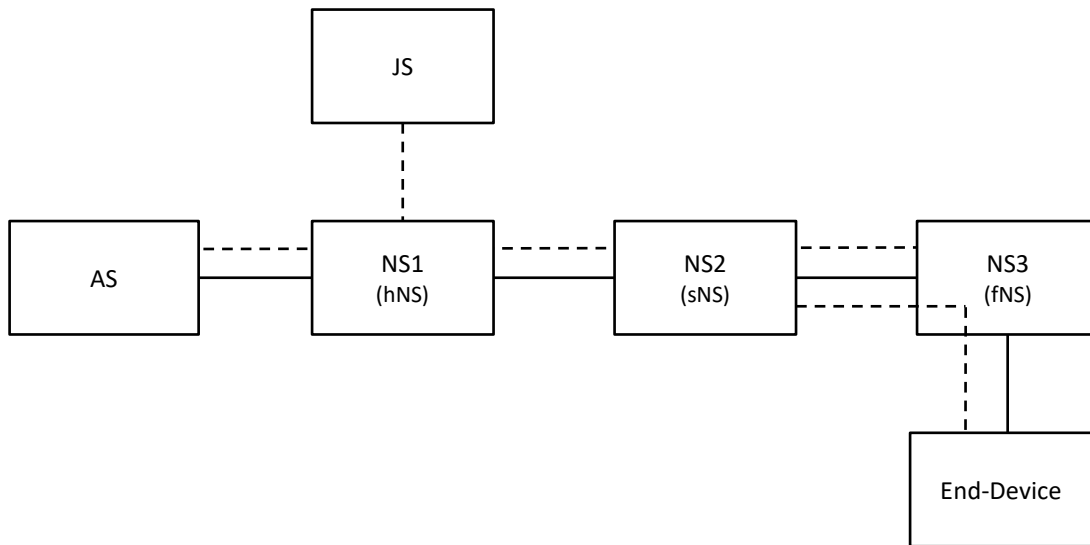

597 **11 Roaming Procedure**

598 **11.1 Types of Roaming**

599
600 There are two types of LoRa roaming, namely Passive Roaming and Handover Roaming.
601 Passive Roaming enables the End-Device to benefit from LoRaWAN service of a Network Server
602 (NS) even when the End-Device is using the Gateway(s) (GWs) under the control of another NS,
603 within the limits of the overlapping RF capabilities (i.e., channels) of the two networks, for that
604 End-Device. LoRa Session and the MAC-layer control of the End-Device are maintained by the
605 former NS, which is called the Serving NS (sNS), whereas the frame forwarding to/from air
606 interface is handled by the latter NS, which is called the Forwarding NS (fNS). There can only be
607 one sNS for a given LoRa Session whereas zero or more fNSs may be involved with the same
608 session.

609
610 There are two types of fNSs: Stateful and stateless. A stateful fNS creates context at the onset of
611 the passive roaming of an End-Device and utilizes that context for processing any subsequent
612 uplink/downlink packets of the same End-Device. A stateless fNS does not create any such
613 context and therefore ends up having to process any uplink/downlink packet independent of each
614 other. It is assumed that whether a given fNS is stateless or stateful is known to its roaming
615 partners by some out of scope mechanism.

616
617 Handover Roaming enables the transfer of the MAC-layer control from one NS to another. hNS
618 maintains the control-plane and data-plane with the JS and the AS even after the End-Device
619 performs a Handover Roaming from one NS to another. hNS stays the same for a given LoRa
620 Session until the End-Device performs the next Join Procedure. Unlike the fNS, the sNS has
621 capability to control the End-Device RF settings, which allows more flexible roaming scenarios.
622

623
624

Figure 6 Use of Handover and Passive Roaming

625
626
627
628
629
630
631

Figure 6 illustrates an example case where both the Handover Roaming and Passive Roaming are used for a LoRa Session simultaneously. In this example, the End-Device was activated through NS1 which acts as the hNS. Subsequently, the End-Device has performed Handover Roaming from NS1 to NS2 when NS2 became the sNS, and also Passive Roaming from NS2 to NS3 when NS3 became the fNS for the End-Device.

632
633
634

Roaming activation is the capability for an End-Device to activate under the coverage of a Visited NS.

635
636
637
638
639
640
641
642

This specification describes the procedures for the following roaming cases:

- Passive Roaming during an ongoing LoRa Session
- Handover Roaming during an ongoing LoRa Session
- Roaming Activation of a new LoRa Session based on Handover Roaming between the Home NS and the Visited NS
- Roaming Activation of a new LoRa Session based on Passive Roaming between the Home NS and the Visited NS

643
644
645
646
647
648

Activation of a new LoRa Session when the Home NS and the Visited NS do not have any roaming agreement is outside the scope of this specification. This includes the case where the two NSs may have roaming agreement with a third NS (e.g., Home NS and 3rd NS having a Handover Roaming agreement, and the 3rd NS and the Visited NS having a Passive Roaming agreement).

11.2 Roaming Policy

649
650
651
652
653
654
655
656

Each network operator SHALL be configured with a roaming policy that can individually allow/disallow Passive Roaming, Handover Roaming, Passive Roaming based Activation, Handover Roaming based Activation with other network operators identified by their NetIDs. For Passive Roaming, the policy SHALL also include whether the uplink MIC check is done by the fNS or not.

657 Each network operator SHALL be configured with a roaming policy that can allow/disallow
 658 Passive Roaming, Handover Roaming, Passive Roaming based Activation, Handover Roaming
 659 based Activation of its individual End-Devices identified by the DevEUI.

660 **11.3 Passive Roaming**

661 This procedure applies to both R1.0 [LW10, LW102] and R1.1 [LW11] End-Devices and
 662 networks.
 663

664 **11.3.1 Passive Roaming Start**

665 Figure 7 illustrates the message flow for Passive Roaming Procedure between two NSs for an
 666 ongoing LoRa Session of an End-Device. Refer to Section 12.2 for Passive Roaming based
 667 Activation of a new LoRa Session.
 668
 669

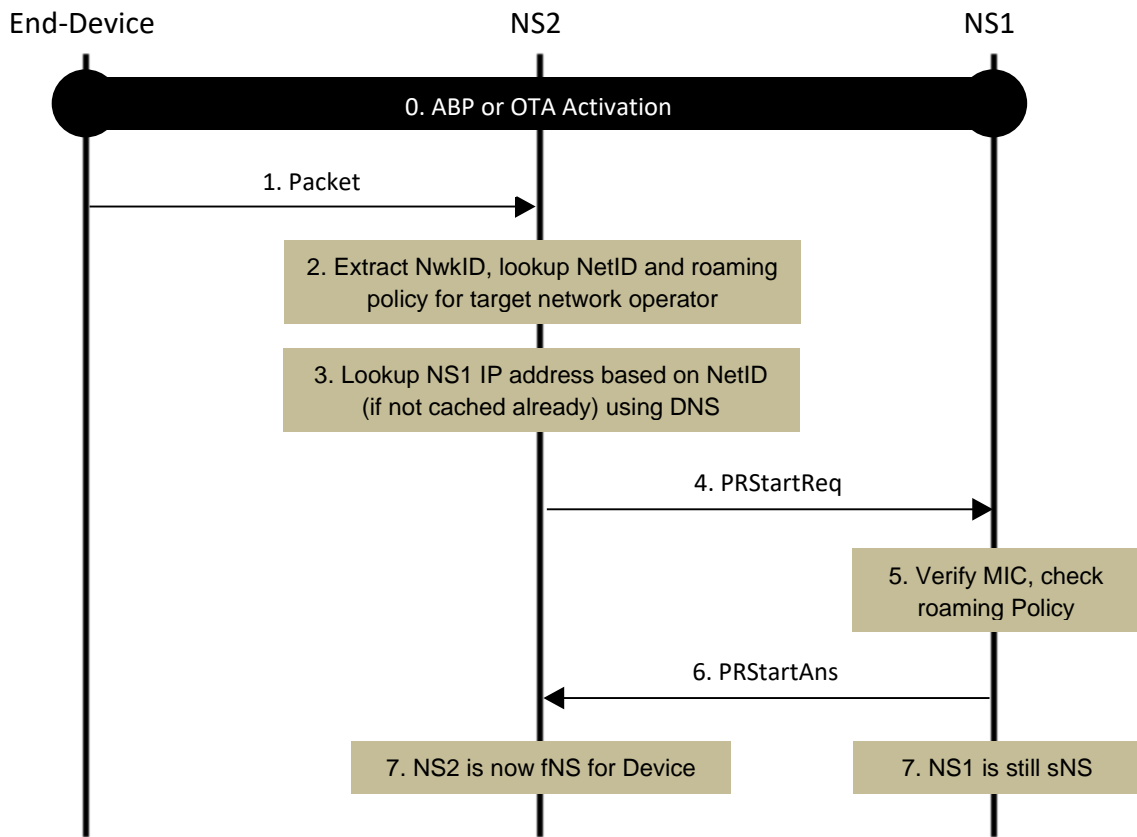

Figure 7 Passive Roaming start

670
 671

672 Step 0:
 673 The End-Device is activated through the NS1.
 674
 675

676 Step 1:
 677 When the End-Device transmits a packet, it is received by the NS2 which does not have any
 678 context associated with the End-Device.
 679
 680

681
 682 Step 2:
 683
 684 If the NS2 is configured to enable passive roaming with other network operators, then the NS2
 685 SHALL attempt to map the NwkID in the received packet with the NetID(s) of the operators with
 686 whom it has a passive roaming agreement. If no match is found, then the NS2 SHALL discard
 687 the packet and the procedure terminates here.
 688
 689 Step 3:
 690
 691 If one or more matching NetIDs are found, then the NS2 SHALL use DNS to lookup (see Section
 692 20) the IP address of NS for each matching NetID (e.g., NS1 in this case), if the NS2 is not
 693 already configured with the IP address/hostname of the NS by an out-of-band mechanism. If
 694 there are more than one match, then Steps 4-6 are executed for each matching NS.
 695
 696 Step 4:
 697
 698 The NS2 SHALL send a PRStartReq message to the NS1, carrying the PHYPayload of the
 699 incoming packet, associated ULMetadata, and DedupWindowSize if the NS2 has performed
 700 deduplication on this packet. Details of metadata are described in Section 17.
 701
 702 Deduplication is the act of batching multiple copies of the same uplink packet in a single backend
 703 transmission. It is at the discretion of the fNS whether it performs deduplication or not. The
 704 period of time awaited by the deduplicating fNS to receive copies of a given uplink packet is
 705 called Deduplication Window.
 706
 707
 708 Step 5:
 709
 710 The NS1 SHALL check if it already has a passive roaming agreement with the network operator
 711 identified by the received NetID, and decide to return a PRStartAns carrying
 712 Result=NoRoamingAgreement if no agreement is found.
 713
 714 The NS1 SHALL extract the DevAddr of the End-Device from the PHYPayload, identify the
 715 corresponding network session integrity key (SNwksIntKey and FNwksIntKey in case of R1.1,
 716 and NwksKey in case of R1.0/1.0.2 End-Device), and verify the MIC in the PHYPayload. If the
 717 DevAddr is not found then the NS1 SHALL return a PRStartAns carrying
 718 Result=UnknownDevAddr. If the FCntUp is already used then the NS1 SHALL return PRStartAns
 719 carrying Result=FrameReplayed. If the MIC verification fails, then the NS1 SHALL return a
 720 PRStartAns carrying Result=MICFailed.
 721
 722 Step 6:
 723
 724 If the identified End-Device is configured to use Passive Roaming and the NS1 decides to enable
 725 or extend the ongoing Passive Roaming via the NS2, then the NS1 SHALL send a PRStartAns to
 726 the NS2 carrying Result=Success, DevEUI, ServiceProfile, and Lifetime associated with the
 727 Passive Roaming. The NS1 SHALL also include FCntUp and FNwksIntKey (in case of R1.1) or
 728 NwksKey (in case of R1.0/1.0.2) in the PRStartAns message if NS1-NS2 Passive Roaming
 729 agreement requires the NS2 to perform MIC check on the uplink packets. If NS1 has already
 730 responded to another copy of the same uplink packet from NS2, then the NS1 SHALL send a
 731 PRStartAns to the NS2 carrying only Result=Success and DupUL.
 732

733 If the NS1 does not wish to enable Passive Roaming via NS2 at this point in time, then it SHALL
734 send a PRStartAns to the NS2 carrying Result=Deferred, and Lifetime. The NS2 SHALL not
735 send any more PRStartReq to the NS1 for the same End-Device for the duration of Lifetime upon
736 receiving this message. If NS1 has already responded to another copy of the same uplink packet
737 from NS2, then the NS1 SHALL send a PRStartAns to the NS2 carrying only Result=Deferred
738 and DupUL.

739
740 If a failure has occurred at Step 5, then the NS1 SHALL send a PRStartAns to the NS2 carrying
741 the identified Result. If NS1 has already responded to another copy of the same uplink packet
742 from NS2, then the NS1 SHALL send a PRStartAns to the NS2 carrying only the same Result
743 and DupUL.

744
745 The NS1 may receive PRStartReq from multiple NSs at the same time, and decide to enable
746 Passive Roaming with zero or more of them.

747
748 The NS1 and the NS2 SHALL terminate the Passive Roaming on their own (i.e., without
749 involving additional signaling with each other) after the associated Lifetime expires, unless the
750 Passive Roaming is extended with a new round of PRStartReq/PRStartAns before the expiration.
751 For stateless fNS operation, the NS1 SHALL set the value of Lifetime associated with the
752 Passive Roaming to zero.

753
754 Step 7:

755
756 The NS2 becomes an fNS for the LoRa Session of the End-Device as soon as it receives the
757 successful PRStartAns. NS1 continues to serve as the sNS.

758
759 After this point on, the NS2 SHALL forward packets received from the End-Device to the NS1,
760 and the NS1 SHALL accept such packets from NS2. Also, the NS1 SHALL note the NS2 as a
761 candidate fNS for sending packets to the End-Device. The NS2 SHALL accept packets sent from
762 NS1 to be forwarded to the End-Device via one of its GWs.

763

764 11.3.2 Packet Transmission

765
766 Figure 8 illustrates the message flow for an End-Device sending and receiving packets using
767 Passive Roaming. Even though the flow shows an uplink packet immediately followed by a
768 downlink packet, the uplink and the downlink parts of the flow can be executed independently in
769 any order as allowed by the class of the End-Device.

770
771 In case of stateless fNS procedure, each uplink packet SHALL be processed according to
772 Section 11.3.1 (not according to the Steps 1-4 in this section, which assume stateful fNS).
773 Nevertheless, Steps 5-11 in this section are applicable to downlink packet processing even for
774 stateless fNS procedure.

775
776 All steps in this section are applicable to uplink and downlink packet processing in case of
777 stateful fNS procedure.

778

779

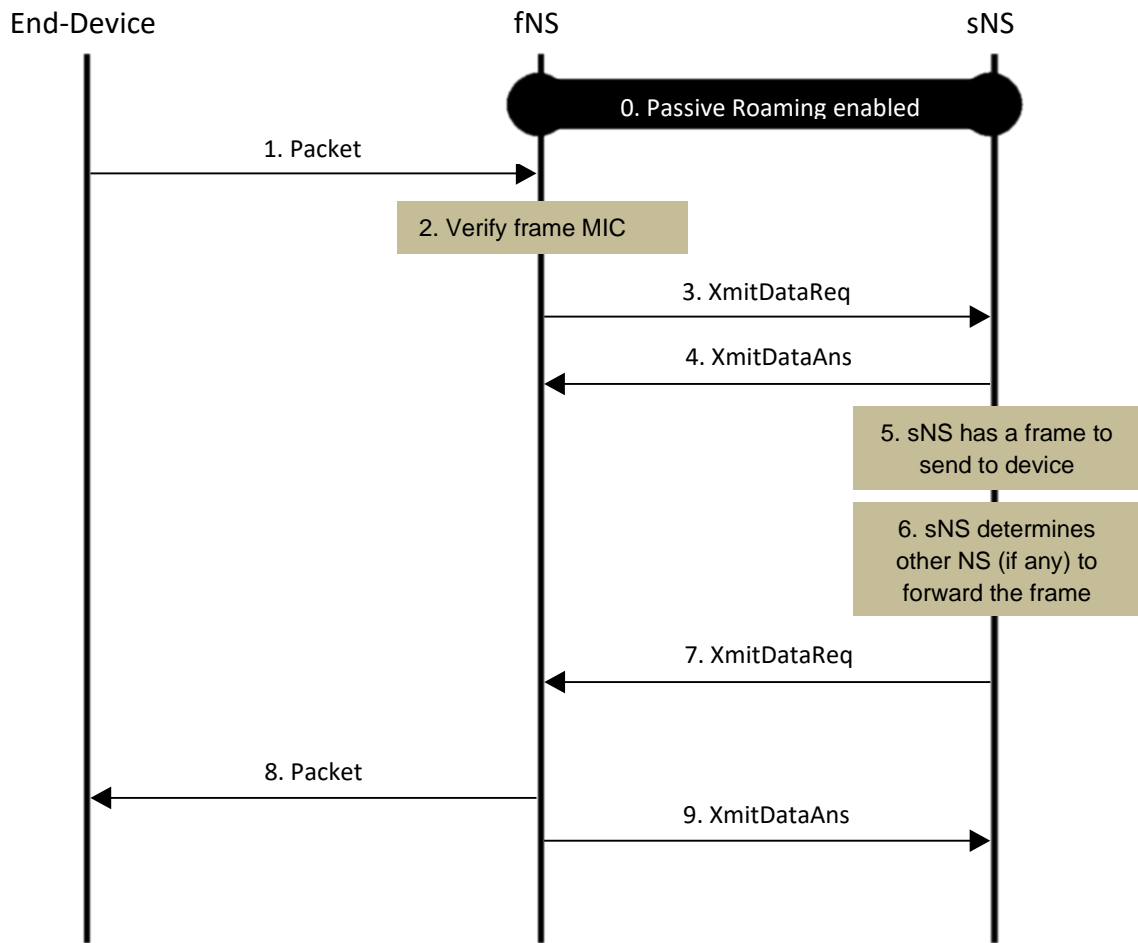

Figure 8 Packet transmission using Passive Roaming

780
781

782

783 Step 0:

784

785 Stateful Passive Roaming is enabled between the fNS and the sNS for the End-Device.

786

787 Step 1:

788

789 The End-Device transmits a packet, which is received by the fNS.

790

791 Step 2:

792

793 If the fNS is required to perform MIC check on the uplink packets based on sNS-fNS Passive
794 Roaming agreement, then the fNS SHALL extract the DevAddr of the End-Device from the
795 packet and identify the FNwkSIntKey/NwkSKey, and verify the MIC in the packet. If no
796 FNwkSIntKey/NwkSKey is found or if the MIC verification fails, then the fNS SHALL discard the
797 packet.

798

799 Step3:

800

801 If an End-Device is identified, the fNS SHALL send a XmitDataReq message to the identified
802 End-Device's sNS carrying the PHYPayload of the received packet and the associated

803 ULMetadata.

804

805 Step 4:

806

807 The sNS SHALL send a XmitDataAns message back to the fNS carrying Result upon receiving
808 the XmitDataReq.

809

810 If the DevAddr is not found then the sNS SHALL return an XmitDataAns carrying
811 Result=UnknownDevAddr. If the FCntUp of the received packet is less than the FCntUp of the
812 last accepted packet for the given End-device, then the sNS SHALL return an XmitDataAns
813 carrying Result=FrameReplayed. If the MIC verification fails, then the sNS SHALL return an
814 XmitDataAns carrying Result=MICFailed. Otherwise, the sNS SHALL return an XmitDataAns
815 carrying Result=Success.

816

817 If the sNS has already responded to another copy of the same uplink packet from the fNS, then
818 the sNS SHALL send a XmitDataAns to the fNS carrying the same Result used in that earlier
819 XmitDataAns and DupUL.

820

821 The subsequent steps are executed when the sNS has a packet to send to the End-Device,
822 which may or may not follow the preceding steps.

823

824 Step 5:

825

826 The sNS has a packet to send to the End-Device.

827

828 Step 6:

829

830 The sNS SHALL determine whether to send the packet via one of the GWs under its control or
831 via a GW under the control of an fNS.

832

833 Step 7:

834

835 If the sNS decides to send the packet via an fNS, the sNS SHALL send XmitDataReq message
836 to the fNS carrying the PHYPayload of the packet, and DLMetadata.

837

838 Step 8:

839

840 If there is an error condition in the received XmitDataReq, the fNS SHALL send a XmitDataAns
841 message to the sNS carrying Result set to a failure value and SHALL NOT attempt to transmit
842 the packet. Otherwise, the fNS SHALL attempt to transmit the packet to the End-Device based
843 on the metadata information it has received from the sNS. If the metadata includes
844 GWInfo.ULToken, then the fNS may use that for selecting the downlink transmission GW. The
845 fNS may fail to transmit the packet due to the timing constraints and the network conditions. In
846 that case, the fNS SHALL not retry transmission.

847

848 Step 9:

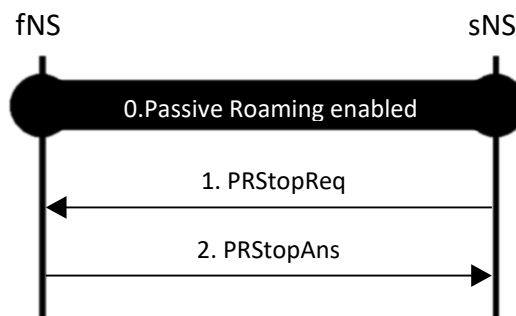

849

850 After attempting to transmit the packet, the fNS SHALL send a XmitDataAns message to the sNS
851 carrying one or both of DLFreq1 and DLFreq2 (depending on whether the packet was transmitted

852 at RX1 or RX2 or both) with Result=Success for successful transmission, and Result=XmitFailed
 853 value otherwise.
 854
 855

856 **11.3.3 Passive Roaming Stop**

857
 858 Figure 9 and Figure 10 illustrate the message flows for terminating Passive Roaming. This
 859 procedure is applicable to only stateful fNS.

860
 861 **Figure 9 sNS-initiated Passive Roaming termination**

862
 863 Step 0:

864
 865 Passive Roaming is enabled between the fNS and the sNS for the End-Device.

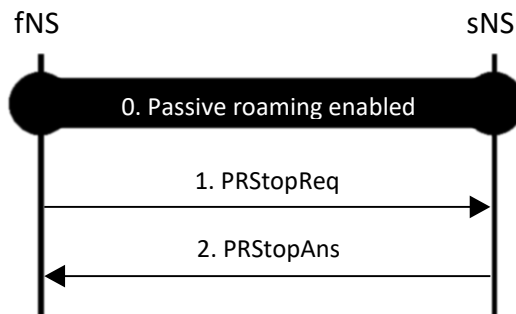

866
 867 Step 1:

868
 869 When sNS decides to terminate Passive Roaming for the End-Device before the expiration of the
 870 Passive Roaming lifetime, the sNS SHALL send a PRStopReq message to the fNS carrying the
 871 DevAddr and DevEUI of the End-Device, and optionally Lifetime. The sNS SHALL include
 872 Lifetime if the fNS is stateful and the sNS does not wish to receive another PRStartReq from the
 873 fNS for the End-Device within the stated time span.

874
 875 Step 2:

876
 877 The fNS SHALL verify that the End-Device with DevEUI is already in Passive Roaming and
 878 associated with the sNS. If both conditions are satisfied, then the fNS SHALL send PRStopAns
 879 message to the sNS carrying Result=Success. Otherwise, the fNS SHALL send PRStopAns
 880 message to the sNS carrying Result=UnknownDevEUI. If the received PRStopReq message
 881 included Lifetime, then the fNS SHALL not send another PRStartReq to the sNS for the End-
 882 Device until the Lifetime expires.

883
 884 In case Passive Roaming for the End-Device was previously terminated with a PRStopReq
 885 message or refused with PRStartAns/Result=Deferred, a new PRStopReq message with a 0 value
 886 for Lifetime enables NS2 to send again PRStartReq for the End-Device as soon as it receives a
 887 packet from that End-Device. This applies only for stateful fNS.
 888

889
890

Figure 10 fNS-initiated Passive Roaming termination

891

892 Step 0:

893

894 Passive Roaming is enabled between the fNS and the sNS for the End-Device.

895

896 Step 1:

897

898 When the fNS decides to terminate Passive Roaming for the End-Device before the expiration of
899 the Passive Roaming lifetime, the fNS SHALL send PRStopReq message to the sNS carrying
900 the DevEUI of the End-Device.

901

902 Step 2:

903

904 The sNS SHALL verify that the End-Device with DevEUI is served by itself and it is already in
905 Passive Roaming with the fNS. If both conditions are satisfied, then the sNS SHALL send
906 PRStopAns message to the fNS carrying Result=Success. Otherwise, the sNS SHALL send
907 PRStopAns message to the fNS carrying Result=UnknownDevEUI.

908

909 After the Passive Roaming terminates, the sNS and the fNS SHALL stop forwarding packets
910 towards each other for the designated End-Device.

911 11.4 Handover Roaming

912

913 This procedure applies to only R1.1 [LW11] End-Devices and networks.

914 11.4.1 Handover Roaming Start

915

916 Figure 11 illustrates the message flow for Handover Roaming Procedure for an ongoing LoRa
917 Session of an End-Device. Refer to Section 12.1 for Handover Roaming based Activation of a
918 new LoRa Session.

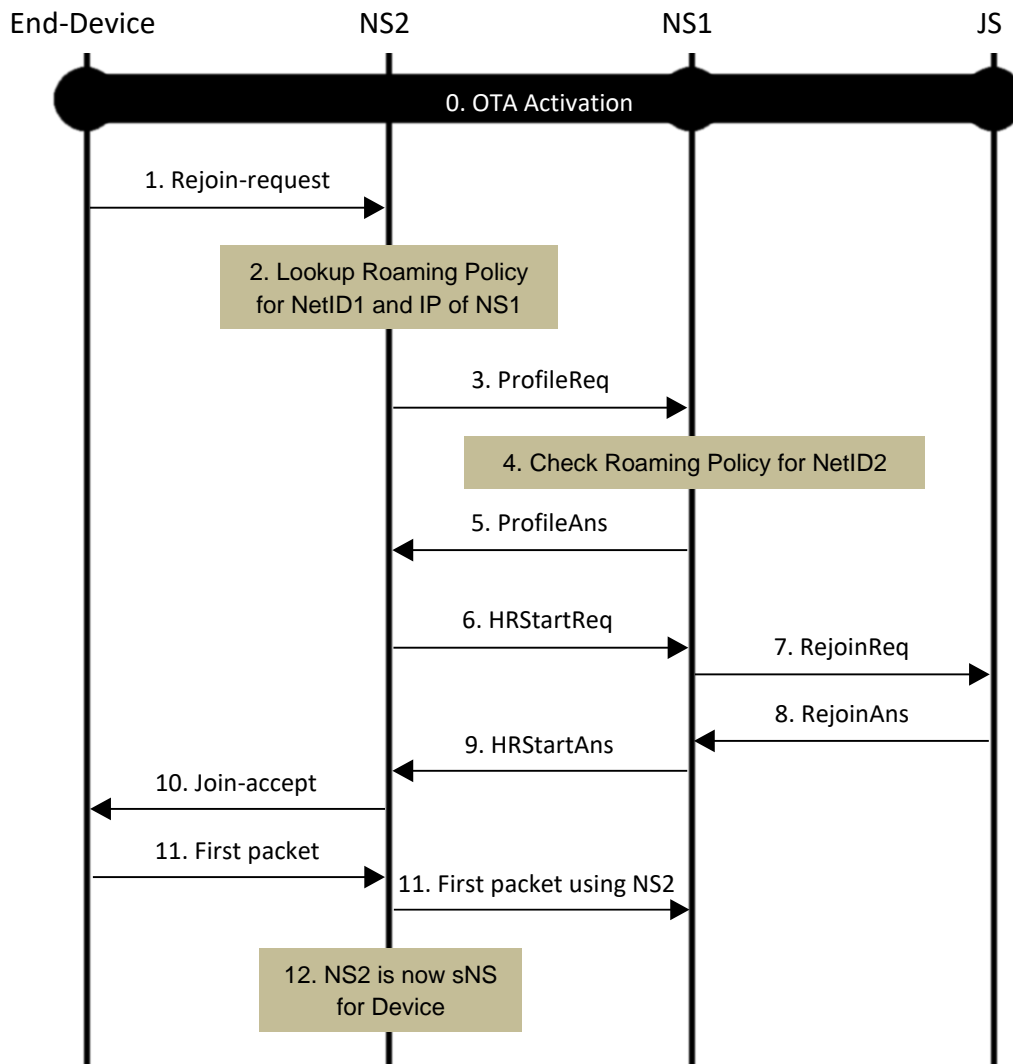

Figure 11 Handover Roaming start

919
920

921

Step 0:

922

Consider the case the End-Device has performed Activation on the NS1. Therefore, NS1 is acting as the hNS for the End-Device.

923

Step 1:

924

The End-Device transmits a Rejoin-request Type 0 message either in response to receiving a ForceRejoinReq MAC command (not shown) or autonomously without an external trigger.

925

Step 2:

926

If the NS2 is acting as the sNS for the End-Device as identified by the received DevEUI, then proceed to Step 6.

927

If the NS2 is not the sNS for the End-Device, then the NS2 SHALL lookup its roaming policy with the operator identified by the NetID in the Rejoin-request. If the NS2 is not configured to enable

928

939 Handover Roaming with the identified operator, then the NS2 SHALL discard the Rejoin-request
 940 and the procedure terminates here. Otherwise, the NS2 SHALL discover the IP address of the
 941 NS1 using DNS (see Section 20), if the NS2 is not already configured with the IP
 942 address/hostname of the NS1 by an out-of-band mechanism.

943
 944 Step 3:

945
 946 The NS2 SHALL send an ProfileReq message to the NS1 carrying DevEUI if the NS2 does not
 947 have the Device Profile of the End-Device in its cache. Steps 4 and 5 are skipped if the
 948 ProfileReq is not sent.

949
 950 Step 4:

951
 952 The NS1 SHALL lookup its roaming policy with the operator identified by the received NetID.

953
 954 Step 5:

955
 956 The NS1 SHALL send an ProfileAns to the NS2 carrying Result=Success, Device Profile, and
 957 Device Profile Timestamp (which carries the timestamp of the last Device Profile change) if the
 958 NS1 is configured to enable Handover Roaming with the NS2 and for the End-Device. If
 959 Handover Roaming is not allowed, then the ProfileAns carries Result=NoRoamingAgreement or
 960 DevRoamingDisallowed, and Lifetime, and the procedure terminates here. The Lifetime allows
 961 the NS1 to request the NS2 not to send additional ProfileReq for the End-Device until the
 962 Lifetime expires.

963
 964 Step 6:

965
 966 If the NS2 is acting as the sNS for the End-Device as identified by the received DevEUI and the
 967 NS2 does not request the NS1 to process the Rejoin-request, then the NS2 SHALL send a
 968 HRStartReq message to the NS1 carrying the PHYPayload with Rejoin-request message,
 969 Informative=True, MACVersion, ULMetadata, Device Profile Timestamp.

970
 971 Otherwise, the NS2 SHALL send a HRStartReq message to the NS1 carrying the PHYPayload
 972 with Rejoin-request message, MACVersion, ULMetadata, Device Profile Timestamp, and the
 973 parameters DevAddr, DLSettings, RxDelay, and optionally CFList identified by the NS2 to be
 974 assigned to the End-Device. The NS2 SHALL set the value of the MACVersion to the highest
 975 common version between the End-Device and the NS2.

976
 977 Step 7:

978
 979 If Handover Roaming is not allowed with the NS2 or for the End-Device, or if the MIC verification
 980 of the message has failed, then the NS1 SHALL proceed to Step 9. Handover Roaming rejection
 981 may be due to the per-NS or per-device roaming policy, or potential unnecessary of Handover
 982 Roaming while the End-Device is already being served by another sNS.

983
 984 If the NS1 determines that the Device Profile has changed since the time indicated by the
 985 received Device Profile Timestamp, then the NS1 concludes that the NS2 has a stale Device
 986 Profile information. In that case, the NS1 SHALL proceed to Step 9.

987
 988 If the NS2 is acting as the sNS for the End-Device as identified by the received DevEUI and the
 989 NS2 does not request the NS1 to process the Rejoin-request, then the NS1 SHALL proceed to
 990 Step 9.

991

992 Otherwise, the NS1 SHALL forward the RejoinReq message to the JS, carrying the PHYPayload
 993 with Rejoin-request message, MACVersion, DevEUI, DevAddr, DLSettings, RxDelay, and CFList
 994 as received from the NS2.
 995
 996 Step 8:
 997
 998 The JS SHALL process the Rejoin-request according to the MACVersion and send a RejoinAns
 999 message to the NS1 carrying Result=Success, the PHYPayload with Join-accept message,
 1000 SNwkSIntKey, FNwkSIntKey, NwkSEncKey, Lifetime if the Rejoin-Request is accepted by the
 1001 JS. Otherwise, the JS SHALL send a RejoinAns to the NS1 carrying Result=UnknownDevEUI or
 1002 MICFailed or FrameReplayed.
 1003
 1004 The NS1 SHALL treat the received Lifetime value as the upper-bound of the session lifetime it
 1005 assigns to the LoRa session.
 1006
 1007 Step 9:
 1008
 1009 If the NS1 determines that the HRStartReq message was coming from the current sNS of the
 1010 End-device that did not request the Rejoin-request to be processed, then the NS1 SHALL send
 1011 HRStartAns message to the NS2 carrying Result=NoAction, and the procedure terminates here.
 1012
 1013 If the NS1 decided not to allow Handover Roaming at Step 7, then the NS1 SHALL send a
 1014 HRStartAns message to the NS2 carrying Result set to a failure value (see Table 25), and
 1015 Lifetime. The Lifetime allows the NS1 to request the NS2 not to send additional HRStartReq for
 1016 the End-Device until the Lifetime expires.
 1017
 1018 If the NS1 concluded that the Device Profile known to the NS2 is stale, then the NS1 SHALL
 1019 send HRStartAns message to the NS2 carrying Result=StaleDeviceProfile, latest Device Profile,
 1020 and its Device Profile Timestamp. The NS2 SHALL jump back to Step 6 to use the new Device
 1021 Profile it just received.
 1022
 1023 Otherwise, the NS1 SHALL forward the payload of the received RejoinAns message in an
 1024 HRStartAns message to the NS2 by also including DLMetadata and Service Profile. The NS1
 1025 SHALL also cache the received SNwkSIntKey, so that it can verify the MIC of the subsequent
 1026 Rejoin-Type 0 messages before deciding to forward them to the JS.
 1027
 1028 Step 10:
 1029
 1030 If the HRStartAns message indicates Success, then the NS2 SHALL forward the received
 1031 PHYPayload with Join-accept message to the End-Device. Otherwise, the NS2 SHALL not send
 1032 any response back to the End-Device.
 1033
 1034 If the Rejoin Procedure was successful, then the NS2 SHALL start forwarding packets received
 1035 from the End-Device to the NS1, and the NS1 SHALL accept such packets from the NS2. Also,
 1036 the NS1 SHALL start forwarding packets received from the AS to the NS2, and the NS2 SHALL
 1037 accept such packets from the NS1.
 1038
 1039 Step 11:
 1040
 1041 The End-Device sends its first uplink packet. The NS2 SHALL transmit that packet to the NS1.
 1042
 1043 Step 12:
 1044

1045 The NS2 starts serving as the sNS and the NS1 stops serving as the sNS as soon as the first
1046 uplink packet is received from the End-Device. Meanwhile, the NS1 continues to serve as the
1047 hNS of the End-Device.
1048

1049 **11.4.2 Packet Transmission**

1050
 1051 In case of Handover Roaming, the hNS and the sNS SHALL use XmitDataReq/Ans messages
 1052 the same way they are used with the Passive Roaming (see Section 11.3.2). The only difference
 1053 is, the hNS-sNS interface carries the FRMPayload instead of the PHYPayload, and the
 1054 ULMetadata/DLMetadata includes different set of objects as described in Section 17.

1055 **11.4.3 Handover Roaming Stop**

1056
 1057 Figure 12 illustrates the hNS terminating the Handover Roaming with the previously serving sNS
 1058 after the End-Device performs Handover Roaming to a new sNS.
 1059

Figure 12 Termination of sNS

1060
 1061
 1062
 1063 Step 0:
 1064
 1065 The End-Device performs Handover Roaming between the NS1 and the NS2.
 1066
 1067 Step 1:
 1068
 1069 The End-Device performs Handover Roaming between the NS1 and the NS3.
 1070
 1071 Step 2:
 1072
 1073 The very first uplink packet is received from the End-Device by the NS1 via the new sNS (NS3).
 1074
 1075 Step 3:
 1076
 1077 The NS1 SHALL send an HRStopReq message to the previously serving sNS (NS2) carrying
 1078 DevEUI when it receives the first packet from the End-Device via the new sNS (NS3).
 1079

1080 HRStopReq message carries optionally Lifetime, which means NS1 does not wish to receive
 1081 another HRStartReq from NS2 for this DevEUI within the stated time span.

1082

1083 Step 4:

1084

1085 The previously serving sNS (NS2) SHALL terminate Handover Roaming and send an
 1086 HRStopAns to the NS1 carrying Result=Success if the NS2 has active Handover Roaming for
 1087 the End-Device identified with the received DevEUI and associated with the NS1. If the NS2
 1088 does not have an active Handover Roaming for the End-Device associated with the NS1, then
 1089 the NS2 SHALL send an HRStopAns to the NS1 carrying Result=UnknownDevEUI.

1090

1091 Step 5:

1092

1093 The NS2 stops serving as the sNS for the LoRa session of the End-Device. If the NS2 has
 1094 enabled Passive Roaming with another NS for the LoRa session of the End-Device, then the
 1095 NS2 SHALL also terminate the Passive Roaming with that NS.

1096

1097 In case Handover Roaming for the End-Device was previously terminated with a HRStopReq
 1098 command, a new HRStopReq command with a 0 value for Lifetime enables NS2 to send again
 1099 HRStart requests for this End-Device as soon as it receives a new Rejoin-request Type 0 message.

1100

1101 Another case of Handover Roaming termination is when the sNS decides to terminate roaming.
 1102 The sNS may precede the termination procedure by sending a ForceRejoinReq command to the
 1103 End-Device. Then, the sNS SHALL send an HRStopReq to the hNS carrying the DevEUI. The
 1104 hNS SHALL terminate Handover Roaming and send an HRStopAns to the sNS carrying
 1105 Result=Success if the hNS has active Handover Roaming for the End-Device identified with the
 1106 received DevEUI and associated with the sNS. If the hNS does not have an active Handover
 1107 Roaming for the End-Device associated with the sNS, then the hNS SHALL send an HRStopAns
 1108 to the sNS carrying Result=UnknownDevEUI. The sNS may still terminate the Handover
 1109 Roaming even if it received a failure Result from the hNS.

1110

1111 **11.4.4 Home NS Regaining Control**

1112

1113 Figure 13 illustrates the message flow of the hNS becoming the sNS by taking the control from
 1114 currently serving sNS.

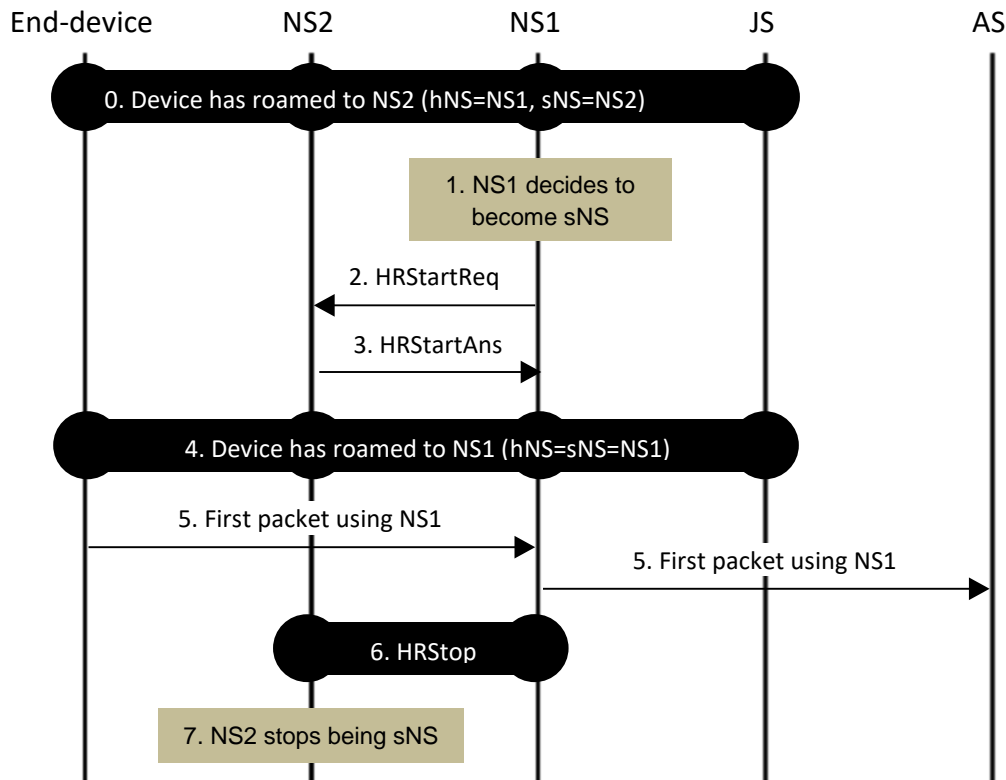

Figure 13 hNS regaining sNS control

1115
1116

1117

1118 Step 0:

1119

1120 The End-Device performs Handover Roaming between the NS1 and the NS2.

1121

1122 Step 1:

1123

1124 The NS1 decides to become the sNS.

1125

1126 Step 2:

1127

1128 The NS1 SHALL send an HRStartReq message to the NS1 carrying DevEUI to trigger the
1129 Handover Roaming.

1130

1131 Step 3:

1132

1133 The NS2 SHALL send HRStartAns to the NS1 carrying Result=Success if the NS2 has active
1134 Handover Roaming for the End-Device identified by the received DevEUI and associated with
1135 the NS1, Result=UnknownDevEUI otherwise.

1136

1137 Step 4:

1138

1139 The NS2 SHALL initiate network-triggered Handover Roaming as described in Section 11.4.1. It
1140 is assumed that the End-Device is within the radio coverage of the NS1 when this procedure is
1141 initiated, and the NS1 rejects Handover Roaming attempt from other NSs, including NS2, and
1142 becomes the sNS.

1143

1144 Step 5:

1145

1146 The very first uplink packet is received from the End-Device directly by the NS1.

1147

1148 Step 6:

1149

1150 The NS1 SHALL perform Handover Roaming Stop Procedure with the NS2 as described in
1151 Section 11.4.3.

1152

1153 Step 7:

1154

1155 The NS2 stops serving as the sNS for the LoRa Session of the End-Device. If the NS2 has
1156 enabled Passive Roaming with another NS for the LoRa session of the End-Device, then the
1157 NS2 SHALL also terminate the Passive Roaming with that NS.

1158

1159 Alternatively, the NS1 can wait until the End-Device decides to initiate Handover Roaming on its
1160 own, effectively skipping the Steps 2 and 3, and continuing with the Steps 4-7.

1161

1162 12 OTA Roaming Activation Procedure

1163

1164 This section describes the procedures for activation of a new LoRa Session when the End-
1165 Device is outside the coverage of its Home NS but under the coverage of a Visited NS.

1166

1167 It is assumed that the Home NS is aware of the roaming capabilities of the Visited NS, and the
1168 Home NS decides which type of activation (Passive Roaming or Handover Roaming based) will
1169 be performed.

1170

1171 12.1 Handover Roaming Activation

1172

1173 This procedure applies to both R1.0 [LW10, LW102] and R1.1 [LW11] End-Devices and
1174 networks.

1175 12.1.1 Handover Roaming Start

1176

1177 Figure 14 illustrates the message flow for OTA Handover Roaming Activation Procedure.

1178

Figure 14 Message flow for Handover Roaming Activation Procedure.

1179
 1180

1181
 1182 Step 1:
 1183
 1184 The End-Device SHALL transmit a Join-request message.
 1185

1186 Step 2:
 1187
 1188 When the NS2 receives the Join-request message, the NS2 SHALL determine whether it is the
 1189 Home NS for the End-Device identified by DevEUI, or not. In this flow, it is assumed that the NS2
 1190 is not the Home NS of the End-Device. See Section 8 for the other case.
 1191
 1192 The NS2 SHALL determine whether it is configured to work with the JS identified by the JoinEUI
 1193 or not. If it is not configured so, then the NS2 SHALL terminate the procedure here.
 1194
 1195 The NS2 SHALL use DNS to lookup the IP address of the JS based on the Join-request
 1196 message (see Section 20 for further details), if the NS2 is not already configured with the IP
 1197 address/hostname of the JS by an out-of-band mechanism. If DNS lookup fails, then the NS2
 1198 SHALL terminate the procedure here.

1199
1200 Step 3:
1201
1202 If the NS2 already knows the identity of the Home NS of the End-Device, then Steps 3 and 4 are
1203 skipped. Otherwise, the NS2 SHALL send an HomeNSReq message to the JS carrying the
1204 DevEUI of the Join-request message.
1205
1206 Step 4:
1207
1208 The JS SHALL send an HomeNSAns message to the NS2 carrying
1209 Result=NoRoamingAgreement if the NS2 is not in the authorized networks as listed in the JS to
1210 serve the End-Device for Roaming Activation, and the procedure terminates here.
1211
1212 The JS SHALL send HomeNSAns message to the NS2 carrying Result=Success, HNSID and
1213 HNetID of the End-Device (NetID of NS1).
1214
1215 Step 5:
1216
1217 If the NS2 already knows the Device Profile of the End-Device, and NS2 only has Handover
1218 Roaming agreement with NS1, then Steps 5 and 6 are skipped. Otherwise, the NS2 SHALL use
1219 DNS to lookup the IP address of the NS1 based on the NetID in the received Join-request
1220 message (see Section 20), if the NS2 is not already configured with the IP address/hostname of
1221 the NS1 by an out-of-band mechanism. If DNS lookup fails, then the NS2 SHALL terminate the
1222 procedure here.
1223
1224 The NS2 SHALL send a ProfileReq message to the NS1 carrying the DevEUI.
1225
1226 Step 6:
1227
1228 If there is no business agreement between the NS1 and the NS2, then the NS1 SHALL send an
1229 ProfileAns message to the NS2 carrying Result=NoRoamingAgreement. If the NS1 could not
1230 identify the End-Device with the DevEUI, then the NS1 SHALL send a ProfileAns message to the
1231 NS2 carrying Result=UnknownDevEUI. If the End-Device is not allowed to perform Roaming
1232 Activation, then the NS1 SHALL send a ProfileAns message to the NS2 carrying
1233 Result=RoamingActDisallowed. Otherwise, assuming the NS1 decides to enable Handover
1234 Roaming Activation, the NS1 SHALL send a ProfileAns message to the NS2 carrying
1235 Result=Success, RoamingActivationType=Handover, Device Profile, and Device Profile
1236 Timestamp (which carries the timestamp of the last Device Profile change).
1237
1238 The following steps describe the procedure when the RoamingActivationType is Handover.
1239
1240 Step 7:
1241
1242 If the Result of incoming ProfileAns indicates Success, or if the Steps 5 and 6 are skipped, then
1243 the NS2 SHALL send an HRStartReq message to the NS1 carrying the PHYPayload with Join-
1244 Request message, MACVersion, ULMetadata, DevAddr, DLSettings, RxDelay, optionally CFList,
1245 and Device Profile Timestamp. The NS2 SHALL set the value of the MACVersion to the highest
1246 common version between the End-Device and the NS2.
1247
1248 Step 8:
1249

1250 When steps 5 and 6 are skipped, if there is no business agreement between the NS1 and the
 1251 NS2 or if the NS1 could not identify the End-Device with the DevEUI or if the End-Device is not
 1252 allowed to perform Roaming Activation then the NS1 shall proceed to Step 10.
 1253

1254 If the NS1 determines that the Device Profile has changed since the time indicated by the
 1255 received Device Profile Timestamp, then the NS1 concludes that the NS2 has a stale Device
 1256 Profile information. In that case, the NS1 SHALL proceed to Step 10. Otherwise, the NS1 sends
 1257 a JoinReq message to the JS carrying the PHYPayload with Join-request message,
 1258 MACVersion, DevEUI, DevAddr, DLSettings, RxDelay, and CFList as received from the NS2.
 1259

1260 Step 9:
 1261

1262 The JS SHALL process the Join-request message according to the MACVersion and send
 1263 JoinAns to the NS1 carrying Result=Success, PHYPayload with Join-accept message, network
 1264 session keys (SNwkSIntKey, FNwkSIntKey, and NwkSEncKey in case of a R1.1, and NwkSKey
 1265 in case of a R1.0/1.0.2 End-Device), encrypted AppSKey or SessionKeyID or both, Lifetime in
 1266 case of success, and Result=UnknownDevEUI in case the End-Device is not recognized by the
 1267 JS, Result=MICFailed in case the MIC of the Join-request fails verification,
 1268 Result=FrameReplayed in case the DevNonce was used before, Result=JoinReqFailed in any
 1269 other error cases. Network session keys, and AppSKey are generated based on the LoRaWAN
 1270 specification [LW10, LW11]. AppSKey is encrypted using a key shared between the JS and the
 1271 AS when it is delivered from the JS to the NS.
 1272

1273 Step 10:
 1274

1275 If there is no business agreement between the NS1 and the NS2, then the NS1 SHALL send an
 1276 HRStartAns message to the NS2 carrying Result=NoRoamingAgreement. If the NS1 could not
 1277 identify the End-Device with the DevEUI, then the NS1 SHALL send a HRStartAns message to
 1278 the NS2 carrying Result=UnknownDevEUI. If the End-Device is not allowed to perform Roaming
 1279 Activation, then the NS1 SHALL send a HRStartAns message to the NS2 carrying Result=
 1280 RoamingActDisallowed.
 1281

1282 If the NS1 concluded that the Device Profile known to the NS2 is stale, then the NS1 SHALL
 1283 send HRStartAns message to the NS2 carrying Result=StaleDeviceProfile, latest Device Profile,
 1284 and its Device Profile Timestamp. In this case, the NS2 SHALL jump back to Step 7 to use the
 1285 new Device Profile it just received.
 1286

1287 Otherwise, the NS1 SHALL send an HRStartAns message to the NS2. The HRStartAns SHALL
 1288 contain the same objects as the JoinAns message described in Step 9 and also the Service
 1289 Profile of the End-Device.
 1290

1291 In case of a R1.1 End-Device, the NS1 SHALL also cache the received SNwkSIntKey, so that it
 1292 can verify the MIC of the subsequent Rejoin-Type 0 messages before deciding to forward them
 1293 to the JS.
 1294

1295 Step 11:
 1296

1297 The NS2 SHALL forward the received PHYPayload with Join-accept message to the End-Device
 1298 if HRStartAns message indicates success. The End-Device SHALL generate network session
 1299 keys, and AppSKey based on the LoRaWAN specification [LW10, LW11] upon receiving the
 1300 Join-accept message.
 1301

1302 If encrypted AppSKey is not made available by the JS to the AS via the NS, then the AS SHALL
1303 retrieve it directly from the JS using the same method as defined in Step 8 of OTA Activation at
1304 Home Procedure (see Section 8).

1305 **12.1.2 Packet Transmission**

1306
1307 The details of uplink and downlink packet transmission between the hNS and the sNS after the
1308 two are engaged in Roaming Activation for an End-Device are same as the Handover Roaming
1309 case as described in Section 11.4.2.

1310 **12.1.3 Handover Roaming Stop**

1311
1312 Handover Roaming Stop Procedure (Section 11.4.3) is used when either the hNS or the sNS
1313 decides to terminate the roaming.
1314

1315 **12.2 Passive Roaming Activation**

1316
1317 This procedure applies to both R1.0 [LW10, LW102] and R1.1 [LW11] End-Devices and
1318 networks.

1319 **12.2.1 Passive Roaming Start**

1320
1321 Figure 15 illustrates the message flow for OTA Passive Roaming Activation Procedure.
1322

Figure 15 Message flow for Passive Roaming Activation Procedure.

1323
1324

1325

Step 1:

1326

The End-Device SHALL transmit a Join-request message.

1327

1328

1329

Step 2:

1330

When the NS2 receives the Join-request message, the NS2 SHALL determine whether it is the Home NS for the End-Device identified by DevEUI, or not. In this flow, it is assumed that the NS2 is not the Home NS of the End-Device. See Section 8 for the other case.

1331

The NS2 SHALL determine whether it is configured to work with the JS identified by the JoinEUI or not. If it is not configured so, then the NS2 SHALL terminate the procedure here.

1332

The NS2 SHALL use DNS to lookup the IP address of the JS based on the Join-request message (see Section 20 for further details), if the NS2 is not already configured with the IP address/hostname of the JS by an out-of-band mechanism. If DNS lookup fails, then the NS2 SHALL terminate the procedure here.

1333

1334

Step 3:

1335

1336

1346 If the NS2 already knows the identity of the Home NS of the End-Device, then Steps 3 and 4 are
1347 skipped. Otherwise, the NS2 SHALL send an HomeNSReq message to the JS carrying the
1348 DevEUI of the Join-request message.

1349

1350 Step 4:

1351

1352 The JS SHALL send an HomeNSAns message to the NS2 carrying
1353 Result=NoRoamingAgreement if the NS2 is not in the authorized networks as listed in the JS to
1354 serve the End-Device for Passive Roaming Activation, and the procedure terminates here.

1355

1356 The JS SHALL send HomeNSAns message to the NS2 carrying Result=Success, HNSID and
1357 HNetID of the End-Device (NetID of NS1).

1358

1359 Step 5:

1360

1361 If the NS2 only has Passive Roaming agreement with NS1, then Steps 5 and 6 are skipped.
1362 Otherwise, the NS2 SHALL use DNS to lookup the IP address of the NS1 based on the NetID
1363 received from the JS, if the NS2 is not already configured with the IP address/hostname of the
1364 NS1 by an out-of-band mechanism. If DNS lookup fails, then the NS2 SHALL terminate the
1365 procedure here.

1366

1367 The NS2 SHALL send a ProfileReq message to the NS1 carrying the DevEUI.

1368

1369 Step 6:

1370

1371 If there is no business agreement between the NS1 and the NS2, then the NS1 SHALL send an
1372 ProfileAns message to the NS2 carrying Result=NoRoamingAgreement. If the NS1 could not
1373 identify the End-Device with the DevEUI, then the NS1 SHALL send a ProfileAns message to the
1374 NS2 carrying Result=UnknownDevEUI. If the End-Device is not allowed to perform Roaming
1375 Activation, then the NS1 SHALL send a ProfileAns message to the NS2 carrying
1376 Result=RoamingActDisallowed. Otherwise, assuming the NS1 decides to enable Passive
1377 Roaming Activation, the NS1 SHALL send a ProfileAns message to the NS2 carrying
1378 Result=Success, RoamingActivationType.

1379

1380 The following describes the behavior when the RoamingActivationType is Passive.

1381

1382 Step 7:

1383

1384 If the Result of incoming ProfileAns indicates Success, or if the Steps 5 and 6 were skipped, then
1385 the NS2 SHALL send an PRStartReq message to the NS1 carrying the PHYPayload with Join-
1386 Request message, ULMetadata, and DedupWindowSize if the NS2 has performed deduplication
1387 on this packet.

1388

1389 Step 8:

1390

1391 When steps 5 and 6 are skipped, if there is no business agreement between the NS1 and the
1392 NS2, or if the NS1 could not identify the End-Device with the DevEUI, or if the End-Device is not
1393 allowed to perform Roaming Activation, or if the NS1 does not wish to enable Passive Roaming
1394 activation via NS2 then the NS1 shall proceed to step 10.

1395

1396 Otherwise, The NS1 SHALL send a JoinReq message to the JS carrying the PHYPayload with
1397 Join-request message, DevEUI, DevAddr, DLSettings, RxDelay, and optionally CFList defined by
1398 the NS1.

1399
 1400 Step 9:
 1401
 1402 The JS processes the Join-request message and sends JoinAns to the NS1 carrying
 1403 Result=Success, PHYPayload with Join-accept message, network session keys (SNwkSIntKey,
 1404 FNwkSIntKey, and NwkSEncKey in case of a R1.1, and NwkSKey in case of a R1.0/1.0.2 End-
 1405 Device), encrypted AppSKey or SessionKeyID or both, Lifetime in case of success, and
 1406 Result=UnknownDevEUI in case the End-Device is not recognized by the JS, Result=MICFailed
 1407 in case the MIC of the Join-request fails verification, Result=FrameReplayed in case the
 1408 DevNonce was used before, Result=JoinReqFailed in any other error cases. Network session
 1409 keys, and AppSKey are generated based on the LoRaWAN specification [LW10, LW102, LW11].
 1410 AppSKey is encrypted using a key shared between the JS and the AS when it is delivered from
 1411 the JS to the NS.
 1412
 1413 Step 10:
 1414
 1415 If there is no business agreement between the NS1 and the NS2, then the NS1 SHALL send an
 1416 PRStartAns message to the NS2 carrying Result=NoRoamingAgreement. If the NS1 could not
 1417 identify the End-Device with the DevEUI, then the NS1 SHALL send a PRStartAns message to
 1418 the NS2 carrying Result=UnknownDevEUI. If the End-Device is not allowed to perform Roaming
 1419 Activation, then the NS1 SHALL send a PRStartAns message to the NS2 carrying Result=
 1420 RoamingActDisallowed. If the NS1 does not wish to enable Passive Roaming activation via NS2,
 1421 then it SHALL send a PRStartAns to the NS2 carrying Result=Deferred, and Lifetime. The NS2
 1422 SHALL not send any more PRStartReq to the NS1 for the same End-Device for the duration of
 1423 Lifetime upon receiving this message. If NS1 has already responded to another copy of the same
 1424 uplink packet from NS2, then the NS1 SHALL send a PRStartAns to the NS2 carrying Result
 1425 according to the previous conditions and DupUL.
 1426
 1427 Otherwise, the NS1 SHALL send a PRStartAns to the NS2 carrying the Result=Success,
 1428 PHYPayload with Join-accept message, DLMetadata, ServiceProfile, and Lifetime associated
 1429 with the Passive Roaming when responding to the PRStartReq that was sent with the chosen
 1430 downlink fNS/gateway. The NS1 SHALL also include DevEUI if NS2 is operating as a stateful
 1431 fNS, and, FCntUp and FNwkSIntKey (in case of R1.1) or NwkSKey (in case of R1.0/1.0.2) in the
 1432 PRStartAns message if NS1-NS2 Passive Roaming agreement requires the NS2 to perform MIC
 1433 check on the uplink packets. If NS1 has already responded to another copy of the same uplink
 1434 packet from NS2, then the NS1 SHALL send a PRStartAns to the NS2 carrying only
 1435 Result=Success and DupUL. If the NS2 is not chosen as the downlink fNS by the NS1 and NS1
 1436 has not already responded to another copy of the same uplink packet from NS2, then the NS1
 1437 SHALL send a PRStartAns to the NS2 carrying only Result=Success.
 1438
 1439 Step 11:
 1440
 1441 The NS2 SHALL forward the received PHYPayload with Join-accept message to the End-Device
 1442 if PRStartAns message indicates success, using the downlink parameters received from NS1.
 1443 The End-Device SHALL generate network session keys, and AppSKey based on the LoRaWAN
 1444 specification [LW10, LW102, LW11] upon receiving the Join-accept message.
 1445
 1446
 1447
 1448 Step 12 :
 1449
 1450 If the NS2 received PHYPayload with Join-accept packet from the NS1, then the NS2 SHALL
 1451 send PRStartNotif message to the NS1 carrying one or both of DLFreq1 and DLFreq2

1452 (depending on whether the packet was transmitted at RX1 or RX2 or both) with Result=Success
1453 for successful transmission, and Result=XmitFailed value otherwise.
1454
1455 If encrypted AppSKey is not made available by the JS to the AS via the NS, then the AS SHALL
1456 retrieve it directly from the JS using the same method as defined in Step 8 of OTA Activation at
1457 Home Procedure (see Section 8).
1458
1459 When the procedure completes successfully, the NS2 becomes the fNS, and the NS1 becomes
1460 the sNS (in addition to being the hNS) of the newly created LoRa Session.
1461

1462 12.2.2 Packet Transmission

1463

1464 The details of uplink and downlink packet transmission between the sNS and the fNS after the
1465 two are engaged in Passive Roaming Activation for an End-Device are same as the Passive
1466 Roaming case as described in Section 11.3.2.

1467

1468 12.2.3 Passive Roaming Stop

1469

1470 Passive Roaming Stop Procedure (Section 11.3.3) is used when either the sNS or the fNS
1471 decides to terminate the roaming.

1472 13 Geolocation

1473

1474 LoRaWAN networks can utilize various techniques relying on the available information (e.g.,
1475 TDoA, RSSI, etc.) to determine the location of the End-devices. A geolocation algorithm running
1476 on the network node uses the metadata of uplink frames and produces geographic coordinates
1477 of the End-device.

1478

1479 Geolocation is an optional feature for networks. A given network MAY be capable of utilizing
1480 ULMetadata to produce geographic coordinates and send those coordinates to the upstream
1481 network node (e.g., the AS is the upstream node for an hNS, hNS for sNS, and sNS for fNS), or
1482 sending the geolocation-specific ULMetadata to the upstream network node, or doing both or
1483 none of these. Network operators are expected to negotiate their geolocation capability with their
1484 partners using an out-of-band mechanism.

1485

1486 When a network has agreed to provide either geolocation-specific ULMetadata or geographic
1487 coordinates, it can be instructed to do so on a per-device basis. ServiceProfile provided by the
1488 upstream network node indicates if one or both type of information is expected to be sent by the
1489 downstream network node to the upstream one for a given End-device. See SendLoc,
1490 LocSolverAuxData, AddLocMetadata objects that are specifically defined for this purpose.

1491

1492 When the downstream network node is providing geolocation-specific metadata, such data is
1493 added to the ULMetadata (see AntennaID, FineRecvTime, FRTContext, and ADRBit objects)
1494 that is carried along the uplink packet. FineRecvTime value MAY be encrypted by the GW, in
1495 which case FRTContext SHALL be provided in order to identify the decryption key. Retrieval of
1496 the decryption key by the consumer of the FineRecvTime is outside the scope of this
1497 specification.

1498

1499 When a downstream network node is providing geographic coordinates, that information is
1500 carried in a dedicated message (see XmitLocReq) sent to the upstream node. The timing of
1501 XmitLocReq message generation depends on the geolocation algorithm generating geographic
1502 coordinates.

1503

1504 The interface required for allowing geolocation algorithm to be executed on a node separate from
1505 the NS or AS is outside the scope of this specification.

1506

1507 14 DevAddr Assignment

1508
 1509 NetID is a 24bit network identifier assigned to LoRaWAN networks by the LoRa Alliance. Values
 1510 0x000000 and 0x000001 are reserved for experimental networks and networks that are not using
 1511 roaming. These values can be used by any network without getting permission from the LoRa
 1512 Alliance. LoRaWAN networks that use roaming need to obtain a unique NetID value assigned by
 1513 the LoRa Alliance.
 1514
 1515

3 bits	21-N bits	N bits
Type	RFU	ID

1516
 1517 **Figure 16 NetID format**

1518
 1519 Figure 16 illustrates the format of the NetID which is composed of the following fields:

1520
 1521 Type: The 3 MSB (Most Significant Bits) of the NetID indicates the NetID Type (0 through
 1522 7).

1523
 1524 ID: Variable length LSB (Least Significant Bits) of NetID as assigned by the LoRa
 1525 Alliance. Length of the ID field depends on the Type of the NetID.
 1526

1527 RFU: If there are any unused bits in the NetID after the Type and ID fields are consumed,
 1528 they are marked as RFU and set to zero. These RFU bits are placed in between the Type
 1529 and ID bits, if those fields do not already consume the 24 bits of the NetID.
 1530

1531 Table 2 provides the details on the Type field setting, number of RFU bits, and length of the ID
 1532 field for each NetID Type.
 1533
 1534

NetID Type	24bit NetID		
	Type field setting (3 MSB)	Number of RFU bits	ID field
0	000	15	6 LSB
1	001	15	6 LSB
2	010	12	9 LSB
3	011	0	21LSB
4	100	0	21LSB
5	101	0	21LSB
6	110	0	21LSB
7	111	0	21LSB

1535
 1536 **Table 2 NetID Types**

1537
 1538 For example, the NetID value 0x000003 is a Type 0 NetID with ID=3, and value 0x6000FF is a
 1539 Type 3 NetID with ID=255.
 1540
 1541

1542

L bits	M bits	N bits
Type Prefix	NwkID	NwkAddr

1543

1544

Figure 17 DevAddr format

1545

1546 DevAddr is an End-Device identifier assigned by the LoRaWAN network. Figure 17 illustrates the
1547 format of the DevAddr which is composed of the following fields:

1548

1549 Type Prefix: Variable length MSB that indicates the NetID Type of the assigning network.

1550

1551 NwkID: Variable length bits that follow the Type Prefix field. They are used for identifying
1552 the network. The value of NwkID is set to the predefined number of LSB of ID field of the
1553 NetID.

1554

1555 NwkAddr: Variable length LSB that is assigned to the End-Device by the network.

1556

1557

1558 Concatenation of Type Prefix and NwkID fields in this specification takes the same value as the
1559 DevAddr field that precedes the NwkAddr field in the LoRaWAN link-layer specifications (e.g.,
1560 the AddrPrefix field in LoRaWAN L2 1.0.4 Specification [LW104], and NwkID field in earlier
1561 versions of the L2 specification).

1562

1563 Table 3 provides the details on the length and setting of Type Prefix field, size of NwkID and
1564 NwkAddr fields for each Type of NetID. The NS shall use the parameters defined in this table
1565 when assigning a DevAddr to its End-Devices based on its NetID.

1566

1567

NetID Type	32bit DevAddr			
	Type Prefix Length (MSB)	Type Prefix Value (binary)	Number of NwkID bits	Number of NwkAddr bits
0	1	0	6	25
1	2	10	6	24
2	3	110	9	20
3	4	1110	11	17
4	5	11110	12	15
5	6	111110	13	13
6	7	1111110	15	10
7	8	11111110	17	7

1568

1569

Table 3 DevAddr format based on the NetID Type

1570

1571 When number of NwkID bits is less than the number of bits in the ID field of the NetID (as in
1572 Types 3 through 7), that means multiple NetIDs are likely to map to the same NwkID value.
1573 Section 11.3 Passive Roaming describes how the fNS tries multiple NSs to find the sNS of the
1574 End-Device.

1575

1576 15 Periodic Recovery

1577
1578 Rejoin-request Type 1 message is defined for restoring connectivity with an End-Device in case
1579 of complete state loss on the sNS. The message is sent by the End-Device periodically for giving
1580 the sNS a chance to recover.

1581
1582 When an NS receives a Rejoin-request Type 1, the NS SHALL determine if it has a valid LoRa
1583 Session with the End-Device as identified by the received DevEUI. If the NS is not acting as the
1584 sNS for the End-Device, then the NS SHALL treat the incoming Rejoin-request Type 1 exactly
1585 same way as it would process a Join-request (i.e., following Activation at Home or Roaming
1586 Activation Procedures by transporting Rejoin-request message instead of the Join-request
1587 message from the NS to the JS). If the NS is acting as the sNS for the End-Device, then the NS
1588 SHALL behave as described in Section 6.2.4.4 of [LW11].

1589
1590 This procedure applies to only R1.1 [LW11] End-Devices and networks.
1591

1592 16 Rekeying and DevAddr Reassignment

- 1593
- 1594 If the sNS decides to either refresh the session keys, reset the frame counters, or assign a new
- 1595 DevAddr to the End-Device without changing the channel definitions, the sNS SHALL send a
- 1596 ForceRejoinReq with RejoinType 2 MAC command to the End-Device.
- 1597
- 1598 The End-Device SHALL send a Rejoin-request Type 2 message when it receives a
- 1599 ForceRejoinReq from the sNS.
- 1600
- 1601 The End-Device SHALL not send a Rejoin-request Type 2 message unless it receives a valid
- 1602 ForceRejoinReq with RejoinType 2 from its sNS. The sNS SHALL discard a received Rejoin-
- 1603 request Type 2 if the sNS has not sent a ForceRejoinReq with RejoinType 2 MAC command to
- 1604 the End-Device.
- 1605
- 1606 Processing of the Rejoin-request Type 2 message is same as processing of Rejoin-request Type
- 1607 0 as described in Section 11.4.1 Handover Roaming Start, considering the receiving NS (NS2 in
- 1608 Figure 11) is already the sNS.
- 1609
- 1610 If the End-Device decides to refresh the session keys or reset the frame counters without
- 1611 receiving a ForceRejoinReq with RejoinType 2 MAC command from the sNS, then the End-
- 1612 Device SHALL send a Join-request.
- 1613
- 1614 This procedure applies to only R1.1 [LW11] End-Devices and networks.
- 1615

1616 **17 Packet Metadata**

 1617 **17.1 UL Packet Metadata**

1618
1619 Each uplink packet received by the LoRa system is associated with a set of parameters obtained
1620 from the radio receiver and the local context of the LoRa Session of the End-Device. Such
1621 parameters are shared among communicating network elements in the form of metadata along
1622 with the packet payload in order to assist uplink transmission. Table 4 illustrates the metadata
1623 details for the uplink packets.

1624
1625

Information element	Generated by	Carried over fNS-sNS interface	Carried over sNS-hNS interface	Description/notes
DevEUI	fNS	Yes	Yes	Included if available to the sender by means of the received packet or local context
DevAddr	fNS	Yes	Yes	Included if available to the sender by means of the received packet or local context
FPort	sNS	No	Yes	sNS sends FRMPayload (not PHYPayload) to the hNS, hence missing FPort is carried separately
FCntDown	sNS	No	Yes	The last downlink application counter used for the End-Device, if available. True 32 bits, if using 32-bit counters. Carries AFCntDown if using R1.1.
FCntUp	sNS	No	Yes	sNS sends FRMPayload (not PHYPayload) to the hNS, hence missing FCntUp is carried separately True 32 bits, if using 32-bit counters. Carries AFCntUp if using R1.1.
Confirmed	sNS	No	Yes	Set to True if MType is Confirmed Data Up, False otherwise
ADRBit	sNS	No	Yes	Set to True if ADR bit is set, False otherwise
DataRate	fNS	Yes	Optional	Generated by the NS controlling the receiving GW
ULFreq	fNS	Yes	Optional	Transmission frequency of the UL packet. Generated by the NS controlling the receiving GW.
Margin	fNS	No	Optional	Reported if requested by the Service Profile.
Battery	fNS	No	Optional	Reported if requested by the Service Profile.
FNSULToken	fNS	Optional	No	Opaque value generated by the fNS, which encodes auxiliary parameters that can assist the fNS later with downlink packet transmission. (See Note 1)
RecvTime	fNS	Yes	Yes	Timestamp of the packet arrival (GPS time with 1sec precision). Generated by the NS controlling the receiving GW.
RFRegion	fNS	Yes	No	RFRegion of the fNS.
GWCnt	fNS	Optional	Optional	Number of Gateways that received the same UL packet within a pre-configured timeout period. Generated by the NS controlling the receiving GW.
GWInfo	fNS	Yes	Optional	List of parameters (see below) for each GW (for each GW antenna, when AntennaID is

				present) that received the same UL packet. Generated by the NS controlling the receiving GWs. Mandatory for fNS only if fNS can send DLs.
> GWID	fNS	Optional	Optional	GW identifier
> AntennaID	fNS	Optional	Optional	Antenna identifier
> FineRecvTime	fNS	Optional	Optional	Nanosec within RecvTime, may be encrypted
> FRTContext	fNS	Optional	Optional	FineRecvTime Context. When included, FineRecvTime is encrypted.
> RFRegion	fNS	Optional	Optional	RF region of the GW
> RFParamSetID	fNS	Optional	Optional	ID of the RF parameter set used by the GW. ID and associated RF parameters are exchanged between the fNS and sNS by an out-of-band mechanism.
> RSSI	fNS	Yes	Optional	Received signal strength indication
> SNR	fNS	Yes	Optional	Signal-to-noise ratio
> Lat	fNS	Optional	Optional	Latitude of the GW/antenna
> Lon	fNS	Optional	Optional	Longitude of the GW/antenna
> Alt	fNS	Optional	Optional	Elevation of the GW/antenna
> ULToken	fNS	Optional	No	Opaque value generated by the GW, which encodes auxiliary parameters that can assist the same GW later with downlink packet transmission. (See Note 1)
> DLAllowed	fNS	Yes	No	Indication from the GW about its resource availability for possible downlink transmission

 1626
 1627

Table 4 Uplink packet metadata

 1628 Note 1 : In case of stateless fNS, at least one of the two information elements SHALL be present.
 1629

1630 **17.2 DL Packet Metadata**

 1631
 1632 Each downlink packet received or generated by the LoRa system is associated with a set of
 1633 parameters obtained from the AS and the local context of the LoRa Session of the End-Device.
 1634 Such parameters are shared among communicating network elements in the form of metadata
 1635 along with the packet payload in order to assist the downlink transmission. Table 5 illustrates the
 1636 metadata details for downlink packets.
 1637

Information element	Generated by	Carried over hNS-sNS interface	Carried over sNS-fNS interface	Description/notes
DevEUI	hNS	Yes	Yes	
FPort	hNS	Yes	No	hNS sends FRMPayload to sNS, hence FPort is carried separately. FPort=0 is disallowed. sNS SHALL return Result=InvalidFPort.
FCntDown	hNS	Yes	No	AFCntDown in R1.1
Confirmed	hNS/sNS	Yes	No	Optionally used for indicating Confirmed transmission
DLFreq1	sNS	No	Yes	Transmission frequency for RX1
DLFreq2	sNS	No	Yes	Transmission frequency for RX2
RXDelay1	sNS	No	Yes	Receive delay for RX1
ClassMode	sNS	No	Yes	Device mode for the DL
DataRate1	sNS	No	Yes	Data rate for RX1
DataRate2	sNS	No	Yes	Data rate for RX2
FNSULToken	sNS	No	Yes	Copy of the last FNSULToken received from the fNS, if available
GWInfo	sNS	No	Optional	List of ULToken parameters (see below) for each GW that received the latest UL packet. Values copied from the latest ULMetadata.
> ULToken	sNS	No	Yes	Copy of the ULToken received for each GW. If provided in ULMetadata, it SHALL be present in DLMetadata.
HiPriorityFlag	sNS	No	Yes	fNS SHOULD do its best to transmit the packet (e.g., set when sending RejoinSetupRequest command)

 1638
 1639 **Table 5 Downlink packet metadata**

1640

1641 **18 Profiles**

 1642 **18.1 Device Profile**

1643
 1644 Device Profile includes End-Device capabilities and boot parameters that are needed by the NS
 1645 for setting up the LoRaWAN radio access service. Table 6 illustrates the information elements that
 1646 are included in a Device Profile. These information elements SHALL be provided by the End-
 1647 Device manufacturer.
 1648

Information element	M/O	Description/notes
DeviceProfileID	M	Unique identifier for the set of End-device parameters
SupportsClassB	M	End-Device supports Class B
ClassBTimeout	O	Maximum delay for the End-Device to answer a MAC request or a confirmed DL frame (mandatory if class B mode supported). Used as CLASS_B_RESP_TIMEOUT in [LW104].
PingSlotPeriod	O	Mandatory if class B mode supported
PingSlotDR	O	Mandatory if class B mode supported
PingSlotFreq	O	Mandatory if class B mode supported
SupportsClassC	M	End-Device supports Class C
ClassCTimeout	O	Maximum delay for the End-Device to answer a MAC request or a confirmed DL frame (mandatory if class C mode supported). Used as CLASS_C_RESP_TIMEOUT in [LW104].
MACVersion	M	Version of the LoRaWAN supported by the End-Device
RegParamsRevision	M	Revision of the Regional Parameters document supported by the End-Device
SupportsJoin	M	End-Device supports Join (OTAA) or not (ABP)
RXDelay1	O	Class A RX1 delay (mandatory for ABP)
RXDROffset1	O	RX1 data rate offset (mandatory for ABP)
RXDataRate2	O	RX2 data rate (mandatory for ABP)
RXFreq2	O	RX2 channel frequency (mandatory for ABP)
FactoryPresetFreqs	O	List of factory-preset frequencies (mandatory for ABP)
MaxEIRP	M	Maximum EIRP supported by the End-Device
MaxDutyCycle	O	Maximum duty cycle supported by the End-Device
RFRegion	M	RF region name
Supports32bitFCnt	O	End-Device uses 32bit FCnt (mandatory for LoRaWAN 1.0 End-Device)

1649
 1650 **Table 6 Device Profile**

1651 “M” in the M/O column indicates “Mandatory to include” (see below for additional considerations),
 1652 and “O” indicates “Optional to include”.

1653
 1654 The sender of the DeviceProfile object MAY exchange the parameters with the receiver using an
 1655 out-of-band mechanism. Taking this into consideration, when the DeviceProfile is delivered using
 1656 an in-band mechanism of this specification, the sender SHALL either include the DeviceProfileID
 1657 only (i.e., all other parameters are omitted even if marked as mandatory in Table 6), or both the
 1658 DeviceProfileID and all other mandatory parameters (and optionally the non-mandatory ones as
 1659 well). The sender SHALL NOT modify parameters once they are bound to a DeviceProfileID.
 1660

 1661 **18.2 Service Profile**

1662

1663 Service Profile includes service parameters that are needed by the NS for setting up the LoRa
1664 radio access service and interfacing with the AS. Table 7 illustrates the information elements that
1665 are included in a Service Profile.
1666

1667

Information element	Carried over hNS-sNS interface	Carried over sNS-fNS interface	Description/notes
ServiceProfileID	M	M	Unique identifier for the set of service parameters
ULRate	O	N/A	Token bucket filling rate, including ACKs (packet/h)
ULBucketSize	O	N/A	Token bucket burst size
ULRatePolicy	O	N/A	Drop or mark when exceeding ULRate
DLRate	O	N/A	Token bucket filling rate, including ACKs (packet/h)
DLBucketSize	O	N/A	Token bucket burst size
DLRatePolicy	O	N/A	Drop or mark when exceeding DLRate
AddGWMetadata	O	O	GW metadata (RSSI, SNR, GW geoloc., etc.) are added to the packet sent to AS
DevStatusReqFreq	O	N/A	Frequency to initiate an End-Device status request (request/day)
ReportDevStatusBattery	O	N/A	Report End-Device battery level to AS
ReportDevStatusMargin	O	N/A	Report End-Device margin to AS
DRMin	O	N/A	Minimum allowed data rate. Used for ADR.
DRMax	O	N/A	Maximum allowed data rate. Used for ADR.
ChannelMask	O	N/A	Channel mask. sNS does not have to obey (i.e., informative).
PRAllowed	O	N/A	Passive Roaming allowed
HRAAllowed	O	N/A	Handover Roaming allowed
RAAllowed	O	N/A	Roaming Activation allowed
SendLoc	O	O	Enable generation of geographic location information
LocSolverAuxData	O	O	Auxiliary data that MAY be needed by the geolocation algorithm when SendLoc=True
AddLocMetadata	O	O	Enable addition of geolocation-specific ULMetadata
TargetPER	O	N/A	Target Packet Error Rate
MinGWDiversity	O	N/A	Minimum number of receiving GWs (informative)

 1668
 1669

Table 7 Service Profile

1670 "M" indicates "Mandatory to include" (see below for additional considerations), "O" indicates
 1671 "Optional to include", and "N/A" indicates "Not applicable".

1672

1673 If an optional information parameter is not sent, then the associated setting is at the discretion of
 1674 the receiving NS.

1675

1676 The sender of the ServiceProfile object MAY exchange the parameters with the receiver using an
 1677 out-of-band mechanism. Taking this into consideration, when the ServiceProfile is delivered
 1678 using an in-band mechanism of this specification, the sender SHALL either include the
 1679 ServiceProfileID only (i.e., all other parameters are omitted even if marked as mandatory in
 1680 Table 7), or both the ServiceProfileID and all other mandatory parameters (and optionally the
 1681 non-mandatory ones as well). The sender SHALL NOT modify parameters once they are bound
 1682 to a ServiceProfileID.

1683

1684 **18.3 Routing Profile**

 1685
 1686 Routing Profile includes information that are needed by the NS for setting up data-plane with the
 1687 AS. Table 8 illustrates the information elements that are included in a Routing Profile.
 1688

Information element	M/O	Description/notes
RoutingProfileID	M	Unique identifier for the set of routing parameters
AS-ID	M	ID of the AS

 1689
 1690 **Table 8 Routing Profile**

 1691 “M” in the M/O column indicates “Mandatory to include” (see below for additional considerations),
 1692 and “O” indicates “Optional to include”.

 1693
 1694 The sender of the RoutingProfile object MAY exchange the parameters with the receiver using
 1695 an out-of-band mechanism. Taking this into consideration, when the RoutingProfile is delivered
 1696 using an in-band mechanism of this specification, the sender SHALL either include the
 1697 RoutingProfileID only (i.e., all other parameters are omitted even if marked as mandatory in
 1698 Table 8), or both the RoutingProfileID and all other mandatory parameters (and optionally the
 1699 non-mandatory ones as well). The sender SHALL NOT modify parameters once they are bound
 1700 to a RoutingProfileID.
 1701

1702 **19 Usage Data Records**

 1703 **19.1 Network Activation Record**

1704
 1705 Network Activation Record is used for keeping track of the End-Devices performing Roaming
 1706 Activation. When the Roaming Activation Procedure takes place, then the NS SHALL generate a
 1707 monthly Network Activation Record for each ServiceProfileID of another NS that has at least one
 1708 End-Device active throughout the month, and dedicated Network Activation Records for each
 1709 activation and deactivation of an End-Device from another NS. Table 9 illustrates the details of
 1710 the Network Activation Record.
 1711

Information element	Description/notes
NSID	ID of the roaming partner NS
NetID	NetID of the roaming partner NS
ServiceProfileID	Service Profile ID
IndividualRecord	Indicates if this is an individual (de-)activation record (as opposed to cumulative record of End-Devices that are active throughout the month)
TotalActiveDevices	Number of End-Devices that have been active throughout the month. Included if this is a cumulative record.
DevEUI	DevEUI of the End-Device that has performed the (de-)activation. Included if this is an IndividualRecord for a (de-)activation event.
ActivationTime	Date/time of the activation. Included if this is an IndividualRecord for an activation event.
DeactivationTime	Date/time of the deactivation. Included if this is an IndividualRecord for a deactivation event.

1712
 1713

Table 9 Network Activation Record

 1714 **19.2 Network Traffic Record**

1715
 1716 Network Traffic Record is used for keeping track of the amount of traffic served for roaming End-
 1717 Devices. The NS that allows roaming SHALL generate a monthly Network Traffic Record for
 1718 each roaming type (Passive/Handover Roaming) under each ServiceProfileID of another NS that
 1719 has at least one End-Device roaming into its network. Table 10 illustrates the details of the
 1720 Network Traffic Record.
 1721

1722
 1723

Information element	Description/notes
NSID	ID of the roaming partner NS
NetID	NetID of the roaming partner NS
ServiceProfileID	Service Profile ID
RoamingType	Passive Roaming or Handover Roaming
TotalULPackets	Number of uplink packets
TotalDLPackets	Number of downlink packets
TotalOutProfileULPackets	Number of uplink packets that exceeded ULRate but forwarded anyways per ULRatePolicy
TotalOutProfileDLPackets	Number of downlink packets that exceeded DLRate but forwarded anyways per DLRatePolicy
TotalULBytes	Total amount of uplink bytes
TotalDLBytes	Total amount of downlink bytes
TotalOutProfileULBytes	Total amount of uplink bytes that falls outside the Service Profile
TotalOutProfileDLBytes	Total amount of downlink bytes that falls outside the Service Profile
TotalLoc	Number of geographic coordinates reported

 1724
 1725

Table 10 Network Traffic Record

 1726
 1727
 1728
 1729

Packet and payload counters are only based on the user-generated traffic. Payload counters are based on the size of the FRMPayload field.

1730 **20 JoinEUI and NetID Resolution**

1731
 1732 When the Network Server receives a Join-request or a Rejoin-request message, it SHALL
 1733 resolve to the IP address of the Join Server firstly by concatenating DevEUI and JoinEUI, and if
 1734 this resolution fails, it will resolve only using the JoinEUI. Similarly, NetID value SHALL be
 1735 resolved to the IP address of the associated Network Server when it is received by a Network
 1736 Server in a Rejoin-request message.

1737
 1738 Both types of address resolutions are carried out by using DNS.

1739
 1740 It should be noted that some organizations need to operate Join Servers without operating a
 1741 network, therefore the Join Server resolution mechanism needs to work without the need to
 1742 allocate a NetID.
 1743

1744 **20.1 NetID and JoinEUI Conversion for the DNS Configuration**

1745
 1746 The LoRa Alliance SHALL establish and operate two dedicated subdomains to resolve Join
 1747 Servers and NetIDs, rooted at JOINEUIS.lorawan.net and NETIDS.lorawan.net, respectively.
 1748

1749 A 24 bit NetID, for e.g. “6292746”, in decimal format is represented as follows in the hexadecimal
 1750 format:

1751
 1752 0x60050A
 1753

1754 Each hexadecimal digit is a nibble, and the order of encoding follows from higher to lower order
 1755 nibble. Concatenating the domain name “NETIDS.lorawan.net” as suffix to the encoded
 1756 hexadecimal conversion of the NetID will result in a Fully Qualified Domain Name (FQDN) as
 1757 follows:

1758
 1759 60050a.NETIDS.lorawan.net
 1760
 1761

1762 A 64bit Join EUI (IEEE EUI-64) is represented as follows in the hexadecimal format:

1763
 1764 0x00005E100000002F
 1765

1766 Similarly, a 64bit DevEUI is represented as follows in the hexadecimal format:

1767
 1768 0x0102030405060708
 1769

1770 Each hexadecimal digit is a nibble, and the order of encoding follows from lower to higher order
 1771 nibble. Hence the nibbles are encoded in reverse order and periods are added between each
 1772 hexadecimal digit.
 1773

1774 By default, concatenating the domain name “JOINEUIS.lorawan.net” as suffix to the encoded
 1775 hexadecimal conversion of the JoinEUI will result in a FQDN as follows:

1776
 1777 f.2.0.0.0.0.0.0.1.e.5.0.0.0.0.JOINEUIS.lorawan.net
 1778
 1779

1780 In the case, wherein the same JoinEUI needs to point to different Join Servers, then the DevEUI
 1781 is concatenated (in the reverse order and periods are added between each hexadecimal DevEUI
 1782 value) with the above JoinEUI conversion:

1783
 1784 `8.0.7.0.6.0.5.0.4.0.3.0.2.0.1.f.2.0.0.0.0.0.0.1.e.5.0.0.0.0.JOINEUIS.lorawan.net`
 1785

1786
 1787 Note: The JoinEUIs or the concatenation of DevEUI and JoinEUIs are encoded in reverse order to
 1788 leverage the benefits of hierarchical provisioning in the DNS. Provisioning in the DNS in the event
 1789 of the same JoinEUI resolving to multiple JS should be left to the expertise of the DNS operator.
 1790 The DNS operator introduces restriction in such cases and provisioning will be done after proper
 1791 testing, which will be taken care of on a case-by-case basis.

1792
 1793
 1794

1795 **20.2 NetID and JoinEUI Provisioning**

1796
 1797 The NetID will be provisioned in the zone “NETIDS.lorawan.net”. The resource corresponding to
 1798 the NetID could be provisioned in different DNS resource record formats (such as NS, CNAME,
 1799 A, AAAA).

1800
 1801 `60050a.NETIDS.lorawan.net IN CNAME example.com.`
 1802 `60050a.NETIDS.lorawan.net IN A 192.0.2.0.`
 1803

1804 Similarly, the zone “JOINEUIS.lorawan.net” could be provisioned in the with different DNS
 1805 resource record formats based on the requirements as follows.

1806
 1807 Only with the JoinEUI:

1808
 1809 `f.2.0.0.0.0.0.0.1.e.5.0.0.0.0. JOINEUIS.lorawan.net. IN CNAME example.net`
 1810

1811 A Full concatenation of DevEUI and JoinEUI, as explained in Section 20.1:

1812
 1813 `8.0.7.0.6.0.5.0.4.0.3.0.2.0.1.f.2.0.0.0.0.0.0.1.e.5.0.0.0.0. JOINEUIS.lorawan.net. IN AAAA`
 1814 `2001:db8:85a3::8a2e:370:7334`
 1815

1816 In cases for operational efficiency, the concatenation could be done using the Wildcard [RFC
 1817 4592] feature of the DNS:

1818
 1819 `*.0.4.0.3.0.2.0.1.f.2.0.0.0.0.0.0.1.e.5.0.0.0.0.JOINEUIS.lorawan.net. IN CNAME`
 1820 `example.com.`
 1821

1822 **20.3 NetID Resolution**

1823
 1824 The input parameter is the 24-bit NetID as carried in the Rejoin-request message sent by the
 1825 End-Device to the Network Server of the Visited Network.

1826
 1827 The Visited Network Server SHOULD convert the NetID received in the Rejoin-request message
 1828 to a DNS query as described in the Section 20.1. The Network Server will use the DNS resolver
 1829 to resolve the IP address of the Home Network Server.

1830

1831 20.4 JoinEUI and DevEUI-JoinEUI Concatenation Resolution

1832
1833 The input parameter is the 64-bit JoinEUI or a concatenation of DevEUI and JoinEUI as carried
1834 in the Join-request message sent by the End-Device to the Network Server of the Home Network
1835 or the Rejoin-request message sent by the End-Device to the Network Server of the Visited
1836 Network.

1837
1838 The receiving Network Server should first make a DNS query concatenating DevEUI and
1839 JoinEUI, and if the resolution fails, it falls back to resolving using the JoinEUI (as explained in
1840 Section 20.1).

1841
1842 Network Server will use the DNS resolver to resolve the IP address of the Join Server.
1843

1844 21 Transport Layer

1845

1846 The LoRaWAN backend interfaces involve interconnection among the network elements, such
1847 as the JS, the NS, and the AS for delivering control signals and data packets. The following
1848 network interfaces are in scope of the current specification:

1849

1850 - AS-JS (optional)

1851 - JS-NS

1852 - NS-NS

1853 A JoinEUI identifies a JS, whereas an NS is identified by its NetID. Multiple JoinEUIs may
1854 identify the same JS. Both the JoinEUI and the NetID can be resolved into the IP address of the
1855 respective servers using DNS.

1856

1857 Network elements SHALL rely on a security solution that can provide mutual end-point
1858 authentication, integrity and replay protection, and confidentiality when communicating with each
1859 other. The choice of mechanism used for achieving these properties is left to the deployments
1860 (e.g., using IPsec VPN, HTTPS, physical security, etc.)

1861

1862 Network element SHALL use HTTP 1.1 [RFC2616] and encode the payloads using JSON.
1863 In order to support sending messages (signal or data) in both directions, a pair of HTTP
1864 connections needs to be setup between the two end-points. Each end-point SHALL initiate and
1865 maintain an HTTP connection with the other end-point. HTTP end-points SHOULD use
1866 persistent connections.

1867

1868 22 Key Transport Security

1869
 1870 Several times during a LoRa Session, keys need to be exchanged between servers (on JS-AS,
 1871 JS-NS or NS-NS interfaces for instance).

1872
 1873 To secure the transport of those keys, Key Encryption Keys (KEK) can be used to encrypt them,
 1874 following the wrapping process defined in the RFC 3394.

1875
 1876 On top of that, each Key Encryption Key is associated with a Key Encryption Key Label (KEKLabel)
 1877 and a wrapping algorithm as defined in the RFC3394 to allow selecting the right key and the right
 1878 algorithm during the unwrapping operation.

1879
 1880 The set of KEK, associated KEKLabels, and algorithm are generated and exchanged between the
 1881 servers during an offline process that is not part of this specification, servers being of 2 kind: the
 1882 key requester and the key sender.

1883
 1884 The decision to wrap or not a key SHALL always be taken by the entity who is in charge of
 1885 delivering the key (i.e., key sender).

1886
 1887 Table 11 provides the details of the KeyEnvelope Object that is used for wrapping keys.
 1888

Information element	M/O	Description/notes
KEKLabel	O	This label identifies the key to be used to unwrap the AESKey. If this value is not present, it means the AESKey is transmitted in clear.
AESKey	M	AESKey carries the RFC3394-wrapped key if the KEKLabel field is present. If the KEKLabel field is not present, then the AESKey carries the key in clear.

1889
 1890

Table 11 KeyEnvelope Object

1891

1892 **23 Messages and Payloads**

 1893 **23.1 Encoding**

1894
 1895 HTTP is used as the transport layer for sending the backend request, answer, and notification
 1896 messages (e.g., JoinReq, JoinAns, ErrorNotif). Following interfaces carry both the backend
 1897 request and answer messages over HTTP Requests while using HTTP Responses simply for
 1898 acknowledging the delivery: fNS-sNS, sNS-hNS. When the delivery is successful, independently
 1899 of the backend answer result, HTTP Response SHOULD use HTTP 2xx Status-Code class of
 1900 response. Only when the delivery is not successful (e.g. malformed HTTP request), HTTP
 1901 Response SHOULD use HTTP 4xx or 5xx Status-Code class of response. In that case the
 1902 backend request SHALL NOT be answered. Following interfaces carry the backend request
 1903 messages over HTTP Requests, whereas the backend answer messages may be carried over
 1904 either the HTTP Response or a subsequent HTTP Request: hNS-JS, vNS-JS, AS-JS. The
 1905 method used by the JS for each backend peer is determined out-of-band. Notification messages
 1906 are one-way messages. They are carried over HTTP Requests while the returned HTTP
 1907 Responses simply acknowledge their delivery.

1908
 1909 Network elements SHALL use JSON data format for sending request, answer, and notification
 1910 messages. When a network element has a message to send to another network element in
 1911 HTTP Request, it SHALL generate an HTTP POST Request for Target URL. Target URL is a
 1912 configuration parameter that is agreed upon between the two network elements interfacing with
 1913 each other. For example, on a given NS, the Target URL for a JS can be
 1914 "https://js.lora_operator.com". Because a given NS may be serving multiple roles at the same
 1915 time (acting as fNS, sNS, and hNS), sender of a request SHALL indicate the intended receiver
 1916 on the target NS by appending one of the following extensions to the Target URL: "/fns", "/sns",
 1917 "/hns". An example Target URL for a request sent to the hNS part of a server is
 1918 "https://ns.lora_operator.com/hns". In case of Roaming Activation, role of the visited NS is not
 1919 determined until it receives the ProfileAns message from hNS. The sender of the backend
 1920 answer messages transmitted prior to that determination (more specifically, HomeNSAns and
 1921 ProfileAns messages) SHALL use the fNS URL of the visited NS.

1922
 1923 HTTP carries the request, answer, and notification messages as a JSON-encoded payload with
 1924 various objects. Messages SHALL use "application/json" Media type (HTTP Content-Type
 1925 header field). Names of the objects that need to be included in a given message are provided in
 1926 the sections that describe the detailed message flows. Encoding of each object type is provided
 1927 in Section 23.3. Each message SHALL include a ProtocolVersion object whose value is set to
 1928 "1.1" by the implementations of this specification, MessageType object that defines the action
 1929 required for that message, and SenderID and ReceiverID objects. The sender of the message
 1930 SHALL set the SenderID to the NetID, JoinEUI, or AS-ID of the sender, depending on whether
 1931 the sender is an NS or JS or an AS, respectively. Similarly, the sender of the message SHALL
 1932 set the ReceiverID to the NetID, JoinEUI, or AS-ID of the intended receiver, depending on
 1933 whether the receiver is an NS or JS or an AS, respectively. The sender SHALL include
 1934 SenderNSID if it is an NS, and ReceiverNSID if the receiver is an NS.

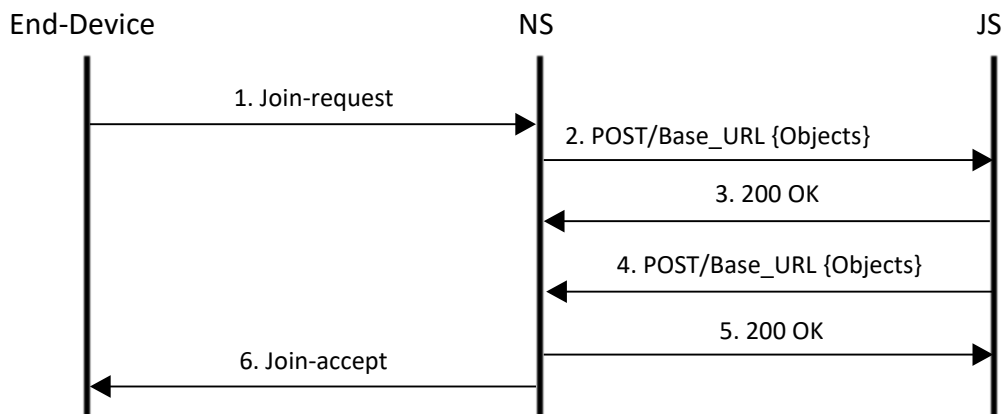

1935
 1936 In order for a network element to be able to match a received message with the pending
 1937 request/answer message a TransactionID is used. The sender of a request message SHALL
 1938 include a TransactionID in the message whose value setting is at the discretion of the sender.
 1939 The sender of an answer or notification message SHALL include the same TransactionID that
 1940 was received in the message that triggered the answer or notification message. If a network
 1941 element receives an answer or notification message for which there is no associated request or
 1942 answer with the TransactionID value, then it SHALL discard the received message.

1943

 1957
 1958
 1959
 1960
 1961
 1962
 1963

If the ProtocolVersion of the received message is not set to “1.0” or “1.1”, then the receiving network element SHALL return a message carrying Result=InvalidProtocolVersion. If the SenderID or the ReceiverID of the received message is unknown to the receiving network element, then it SHALL return a message carrying Result=UnknownSender or UnknownReceiver. When the MessageType is unknown to the receiver network element, it SHALL return a message with the same MessageType carrying Result=MalformedRequest.

A network element MAY include SenderToken in its messages if it expects the target network element to echo the same value in ReceiverToken for each subsequent messages that are associated with the same End-Device. The sNS SHALL NOT send a SenderToken when communicating with a stateless fNS, as the fNS cannot store that token. A network element SHALL include a ReceiverToken in its messages if it received a SenderToken from the target network element for the same End-Device. In that case the network element SHALL copy the value of the received SenderToken to the transmitted ReceiverToken.

Figure 18 and Figure 19 illustrate two variants of the HTTP message flow for OTA Activation at Home Procedure as an example. While these figures are showing the HTTP details, rest of the figures in this document only illustrate the backend messages (e.g., not showing HTTP Responses unless they carry a backend message as a payload).

Table 15 Result Object

2044

2045 Table 16 provides the details of the KeyEnvelope Object. This object format is used for
 2046 SNwkSIntKey, FNwkSIntKey, NwkSEncKey, NwkSKey, and AppSKey Objects.

2047

2048

Object Name	Value Type	Notes
KEKLabel	String	Max 16 characters
AESKey	String	Hexadecimal representation in ASCII format

2049

2050

Table 16 KeyEnvelope Object

2051

2052 Table 17 provides the details of the DeviceProfile Object.

2053

Object Name	Value Type	Notes
DeviceProfileID	String	Max 64 characters
SupportsClassB	Boolean	
ClassBTimeout	Number	Unit: seconds
PingSlotPeriod	Number	
PingSlotDR	Number	
PingSlotFreq	Number	
SupportsClassC	Boolean	
ClassCTimeout	Number	Unit: seconds
MACVersion	String	Example: "1.0.2" [LW102]
RegParamsRevision	String	Example: "B" [RP102B]
RXDelay1	Number	
RXDROffset1	Number	
RXDataRate2	Number	Example (DR0): 0. See data rate tables in Regional Parameters document.
RXFreq2	Number	Value of the frequency, e.g., 868.10
FactoryPresetFreqs	Array of Numbers	
MaxEIRP	Number	In dBm
MaxDutyCycle	Number	Example: 0.10 indicates 10%
SupportsJoin	Boolean	
RFRegion	String	See Note 2
Supports32bitFCnt	Boolean	

2054

2055

Table 17 DeviceProfile Object

2056

2057 Note 2: Name of the RF region (e.g., "EU868", "US902", etc.). The valid values are provided by
 2058 the RFRegion parameter defined in the Regional Parameters document for each region.

2059

2060 Table 18 provides the details of the ServiceProfile Object.
2061

Object Name	Value Type	Notes
ServiceProfileID	String	Max 64 characters
ULRate	Number	
ULBucketSize	Number	
ULRatePolicy	String	Acceptable values: "Drop", "Mark"
DLRate	Number	
DLBucketSize	Number	
DLRatePolicy	String	Acceptable values: "Drop", "Mark"
AddGWMetadata	Boolean	
DevStatusReqFreq	Number	Unit: requests-per-day
ReportDevStatusBatery	Boolean	
ReportDevStatusMargin	Boolean	
DRMin	Number	
DRMax	Number	
ChannelMask	String	Hexadecimal representation in ASCII format
PRAllowed	Boolean	
HRAAllowed	Boolean	
RAAllowed	Boolean	
SendLoc	Boolean	
LocSolverAuxData	String	Hexadecimal representation in ASCII format (max 512 characters)
AddLocMetadata	Boolean	
TargetPER	Number	Example: 0.10 indicates 10%
MinGWDiversity	Number	

2062
2063

Table 18 ServiceProfile Object

2064 Table 19 provides the details of the RoutingProfile Object.
2065
2066

Object Name	Value Type	Notes
RoutingProfileID	String	Max 64 characters
AS-ID	String	Value can be IP address, DNS name, etc. (max 128 characters)

2067
2068

Table 19 RoutingProfile Object

2069
2070

2071 Table 20 provides the details of the ULMetaData Object.
2072

Object Name	Value Type	Notes
DevEUI	String	Hexadecimal representation in ASCII format, big-endian, no separator
DevAddr	String	Hexadecimal representation in ASCII format
FPort	Number	Integer
FCntDown	Number	Integer
FCntUp	Number	Integer
Confirmed	Boolean	
DataRate	Number	See data rate tables in Regional Parameters document
ULFreq	Number	Floating point (MHz)
Margin	Number	Integer value reported by the End-device in DevStatusAns
Battery	Number	Integer value reported by the End-device in DevStatusAns
FNSULToken	String	Hexadecimal representation in ASCII format (max 512 characters)
RecvTime	String	Use ISO 8601
RFRegion	String	See Note 2 (above)
GWCnt	Number	Integer
GWInfo	Array of GWInfoElement Objects	See Table 21

2073
2074

Table 20 ULMetadata Object

2075 Table 21 provides the details of the GWInfoElement Object.
2076
2077

Object Name	Value Type	Notes
GWID	String	Hexadecimal representation of 32bit value in ASCII (see Note 3)
AntennaID	Number	
FineRecvTime	Number	
FRTContext	String	Hexadecimal representation in ASCII format (max 512 characters)
RFRegion	String	See Note 2 (above)
RFPParamSetID	String	
RSSI	Number	Signed integer, unit: dBm
SNR	Number	Unit: dB
Lat	Number	Unit: DD, based on WGS84
Lon	Number	Unit: DD, based on WGS84
Alt	Number	Unit: meter, based on WGS84
ULToken	String	Hexadecimal representation in ASCII format (max 512 characters)
DLAllowed	Boolean	

2078
2079

Table 21 GWInfoElement Object

2080 Note 3 : Class B beacons can carry only 24bit values to identify gateways. The 24 LSBs of GWID
 2081 can be used in the beacon payload when the network intends to convey this value.
 2082

2083

2084 Table 22 provides the details of the DLMetaData Object.
 2085

Object Name	Value Type	Notes
DevEUI	String	Hexadecimal representation in ASCII format
FPort	Number	
FCntDown	Number	
Confirmed	Boolean	
DLFreq1	Number	At least DLFreq1 or DLFreq2 SHALL be present.
DLFreq2	Number	At least DLFreq1 or DLFreq2 SHALL be present.
RXDelay1	Number	
ClassMode	String	Only values "A" and "C" are supported
DataRate1	Number	Present only if DLFreq1 is present
DataRate2	Number	Present only if DLFreq2 is present
FNSULToken	String	Hexadecimal representation in ASCII format (max 512 characters)
GWInfo	Array of GWInfoElement Objects	See Table 21
HiPriorityFlag	Boolean	

2086
 2087

Table 22 DLMetadadata Object

2088
 2089

2090 Table 24 provides the details of LocationInfo Object.

Object Name	Value Type	Notes
LocTime	String	Use ISO 8601
Lat	Number	Unit: DD, based on WGS84
Lon	Number	Unit: DD, based on WGS84
Alt	Number	Unit: meter, based on WGS84
LocRadius	Number	Horizontal tolerance, unit: meter
AltRadius	Number	Vertical tolerance, unit: meter
FCntUp	Number	FCntUp of most recent packet used in calculation

2091

2092

Table 23 LocationInfo Object

2093

2094 Table 24 provides the details of VSExtension Object.

2095

Object Name	Value Type	Notes
VendorID	String	OUI of the vendor, hexadecimal representation in ASCII format (max 10 characters)
Object	opaque	The nature of the object is not defined

2096

2097

Table 24 VSExtension Object

2098

2099 **23.5 Result Codes**

 2100
 2101
 2102

Table 25 provides list of values that can be assigned to the Result Object.

Value	Description
"Success"	Success, i.e., request was granted
"NoAction"	Used by hNS to acknowledge receipt of Rejoin-request by the current sNS
"MICFailed"	MIC verification has failed
"FrameReplayed"	Received frame is a replay (DevNonce/RJCount/FCntUp reused)
"JoinReqFailed"	JS processing of the JoinReq has failed
"NoRoamingAgreement"	There is no roaming agreement between the operators
"DevRoamingDisallowed"	End-Device is not allowed to roam
"RoamingActDisallowed"	End-Device is not allowed to perform activation while roaming
"ActivationDisallowed"	End-Device is not allowed to perform activation
"UnknownDevEUI"	There is no context related to this DevEUI
"UnknownDevAddr"	There is no context related to this DevAddr
"UnknownSender"	SenderID or SenderNSID is unknown or mismatch between the two
"UnkownReceiver"	ReceiverID or ReceiverNSID is unknown or mismatch between the two
"Deferred"	Passive Roaming is not allowed for a period of time
"XmitFailed"	fNS failed to transmit DL packet
"InvalidFPort"	Invalid FPort for DL (e.g., FPort=0)
"InvalidProtocolVersion"	ProtocolVersion is not supported
"StaleDeviceProfile"	Device Profile is stale
"MalformedMessage"	JSON parsing failed (missing object or incorrect content)
"FrameSizeError"	Wrong size of PHYPayload or FRMPayload
"Other"	Used for encoding error cases that are not standardized yet

 2103
 2104

Table 25 Valid values for Result Object

 2105
 2106

When used, Description field of Result Object optionally reveals the error details.

2107 **Glossary**

2108		
2109	ABP	Activation by Personalization
2110	ADR	Adaptive Data Rate
2111	API	Application Programming Interface
2112	AS	Application Server
2113	DNS	Domain Name Server
2114	ED	End-device
2115	fNS	Forwarding Network Server
2116	GW	LoRa Gateway
2117	HTTP	HyperText Transfer Protocol
2118	hNS	Home Network Server
2119	IP	Internet Protocol
2120	JS	Join Server
2121	JSON	JavaScript Object Notation
2122	KEK	Key Encryption Key
2123	LoRa [™]	Long Range modulation technique
2124	LoRaWAN [™]	Long Range network protocol
2125	MAC	Medium Access Control
2126	MIC	Message Integrity Code
2127	NAPTR	Naming Authority Pointer
2128	NS	Network Server
2129	OTA	Over-the-Air
2130	RF	Radio Frequency
2131	RSSI	Received Signal Strength Indicator
2132	SF	Spreading Factor
2133	SIP	Session Initiation Protocol
2134	SNR	Signal-to-Noise Ratio
2135	sNS	Serving Network Server
2136	TDofA	Time Difference of Arrival
2137

2141 [LW10] LoRaWAN Specification, Version 1.0, LoRa Alliance, January 2015.

2142 [LW102] LoRaWAN Specification, Version 1.0.2, LoRa Alliance, July 2016.

2143 [LW104] LoRaWAN Specification, Version 1.0.4, LoRa Alliance, Oct 2020.

2144 [RP102B] LoRaWAN 1.0.2 Regional Parameters, Revision B, LoRa Alliance, Feb 2017.

2145 [LW11] LoRaWAN Specification, Version 1.1, LoRa Alliance, October 2017.

2146 Revisions

2147

2148 Revision 1.1:

- 2149 - Geoloc support added for roaming interfaces
- 2150 - NSs identified by NSID, allowing use of NetID=0/1 in various cases
- 2151 - PRStartNotif and ErrorNotif messages defined
- 2152 - sNS indication for duplicate ULs defined
- 2153 - fNS dedup window size defined as payload object
- 2154 - DevEUI added to every message so fNS can identify/count devices
- 2155 - DevEUI-based JS URL lookup added to DNS
- 2156 - Fixed the error in Type 3 and Type 4 NwkID lengths
- 2157 - DeviceProfile RXDataRate2 unit defined
- 2158 - PRStartAns allowed to carry PHYPayload(Join-accept)
- 2159 - RFRegion names standardized
- 2160 - RFPParamSetID defined
- 2161 - Treatment of unspecified MessageTypes defined
- 2162 - UnknownDevAddr result code used in message flows
- 2163 - /fNS, /sNS, hNS suffixes required to be used in NS URLs
- 2164 - Margin and Battery limited to sNS
- 2165 - Max size set for String types
- 2166 - fNS use of ServiceProfile limited to only some of the info elements
- 2167 - DLMetadata added to PRStartAns for Roaming Activation
- 2168 - HTTP Content-Type and Status-Code defined
- 2169 - Error result codes clarified, added, and used in message flows
- 2170 - NetID example fixed
- 2171 - sNS forced to forward Rejoin-request to hNS
- 2172 - Clarified that figures are informative, tables are normative
- 2173 - DeviceProfile not needed in HRStartReq
- 2174 - XmitDataAns result codes clarified
- 2175 - GWID length corrected
- 2176 - DNS usage details refined
- 2177 - Device/Service/RoutingProfileID use clarified
- 2178 - Only a single Join-accept sent in response to multiple Join-requests
- 2179 - HTTP Status-Code use clarified
- 2180 - FrameReplayed clarified
- 2181 - GWInfoElement format refined
- 2182 - Message type and payload object names declared to be case-sensitive
- 2183 - Relationship between TypePrefix|NwkID in this spec and AddrPrefix in L2 spec clarified
